

NCCOS HAB DETECTION & FORECASTING

Sherri L. Fields
NCCOS Charleston Lab Director &
Deputy Division Chief
Stressor Detection & Impacts Division

Outline

- Division Overview
- HABHRCA Directive
- Role Under Strategic Plan
- People & Places
- Implementation Plan

Overview: Stressors

- Alter state of ecosystem
- Include
 - Harmful algal blooms
 - Chemical contaminants
 - Nutrients
 - Pathogens
- Impacts
 - Species
 - Ecosystems
 - People
 - Economies

HABHRCA Authorization

- Increase the availability to appropriate public and private entities
 - Analytical facilities & technologies
 - Reference and research materials
 - Operational forecasts
 - Mitigate adverse impacts of HABs
- Working cooperatively and avoiding duplication

Vision: Our Future

Science serves to sustain thriving coastal communities and economies

Mission: Our Purpose

Deliver ecosystem science solutions for stewardship of the nation's ocean and coastal resources

PRIORITY: Stressor Impacts & Mitigation

SUBPRIORITIES

SDI

CRP

Harmful Algal Bloom
Detection &
Forecasting

Bioeffects of
Contaminants &
Nutrients

HAB Forecasting
Branch

HAB Monitoring &
Reference
Branch

SDI: HAB Detection & Forecasting

HAB Forecast Branch

- Conducts applied research needed to inform ecological forecasts
- Advances satellite methods for detecting HABs
- Develops and delivers ecological forecasts
- Helps stakeholders mitigate HAB impacts

HAB Monitoring & Reference Branch

- Develops monitoring technology
- Validates methods (human & autonomous)
- Validates measurements
- Serves as reference laboratory
- Trains managers and volunteers

SDI People

HAB Forecast Branch

- Supervisory Research Ecologist (1)
- Fish Biologist (molecular biologist) (1)
- Oceanographer (5)
- Physical Scientist (1)
- Contract Oceanographer (5)
- Contract Meteorologist (1)
- NRC Post Doc (1)

HAB Monitoring and Reference Branch

- Supervisory Research Physiologist (1)
- Research Chemist (3)
- Chemist (1)
- Research Oceanographer (2)
- Laboratory Technician (2)
- Contract Oceanographer (2)
- Contract Mass Spectrometrist (1)

SDI Facilities

“...R&D essential to accomplishing NOAA’s missions depends on sophisticated research facilities and hardware, including laboratories, instrumentation..... “ NAO 216-115A

NCCOS Program Office and Headquarters — Silver Spring, MD.

- Offices and state of the art computational facilities
- Recognized internationally for work on HAB, contaminants and Marine spatial ecology

The NOAA Beaufort NC Laboratory

- Shared with NOAA Fisheries and National Estuarine Research Reserve
- Recognized research on harmful algal blooms, seagrasses, coral reefs, seafloor mapping, aquaculture, and salt marsh ecology.

NCCOS’s Charleston SC Laboratory and Hollings Marine Laboratories (HML)

- Charleston lab: Recognized for HAB research, chemistry, toxicology, molecular, microbiology, and ecology
- HML: partnership between NCCOS, the NIST, MUSC, SC Dept. Natural Resources, and the College of Charleston

NCCOS HAB Implementation Plan

Focus Area 1

- Lake Erie HAB Forecast
- Gulf of Maine Forecast
- Gulf of Mexico Forecast
- Assess R&D forecasts for potential transition

Focus Area 3

- Phytoplankton Monitoring Network
- Expand customer accessibility to HAB observations
- Phytoplankton monitoring network technologies

Focus Area 4

- Second Generation ESPs
- Third Generation ESPs
- Flow Cytobot
- Multiple toxin sampling and detection
- Address detection technology gaps

Focus Area 5

- Assure harmonized standard methods and reference material
- Publish guidance seafood safety managers
- Analytical method development
- Reference material calibration
- Promote user laboratories

Harmful Algal Bloom Forecasting Branch

To develop and maintain products useful for the American public

- Seek stakeholder engagement
- Evaluate if significant HAB issue present
- Can we fill critical gaps not provided by others
- Engage community involved in research activities and participate providing observations

To accomplish this we:

- Participate in maintenance and growth of observations networks
 - Ever improving satellite surveillance
 - Utilization and improvement of robust computing platforms,
- Cross-NOAA coordination and engagement with regional decision makers and partners
 - IOOS, Regional Associations [RAs]
 - Non-governmental organizations [NGOs] and academic institutions) who drive product development and implementation
- Conduct laboratory and field research essential to inform forecast products

Overview

- Projects involving ecological, toxicological and molecular expertise
 - Alaska paralytic shellfish poisoning
 - Ciguatera fish poisoning
- Future Directions
 - Transition activities
 - Chesapeake Bay
 - North Carolina
 - Layer on National map for aquaculture

Issue: *Alexandrium* & Paralytic Shellfish Poisoning in Alaska

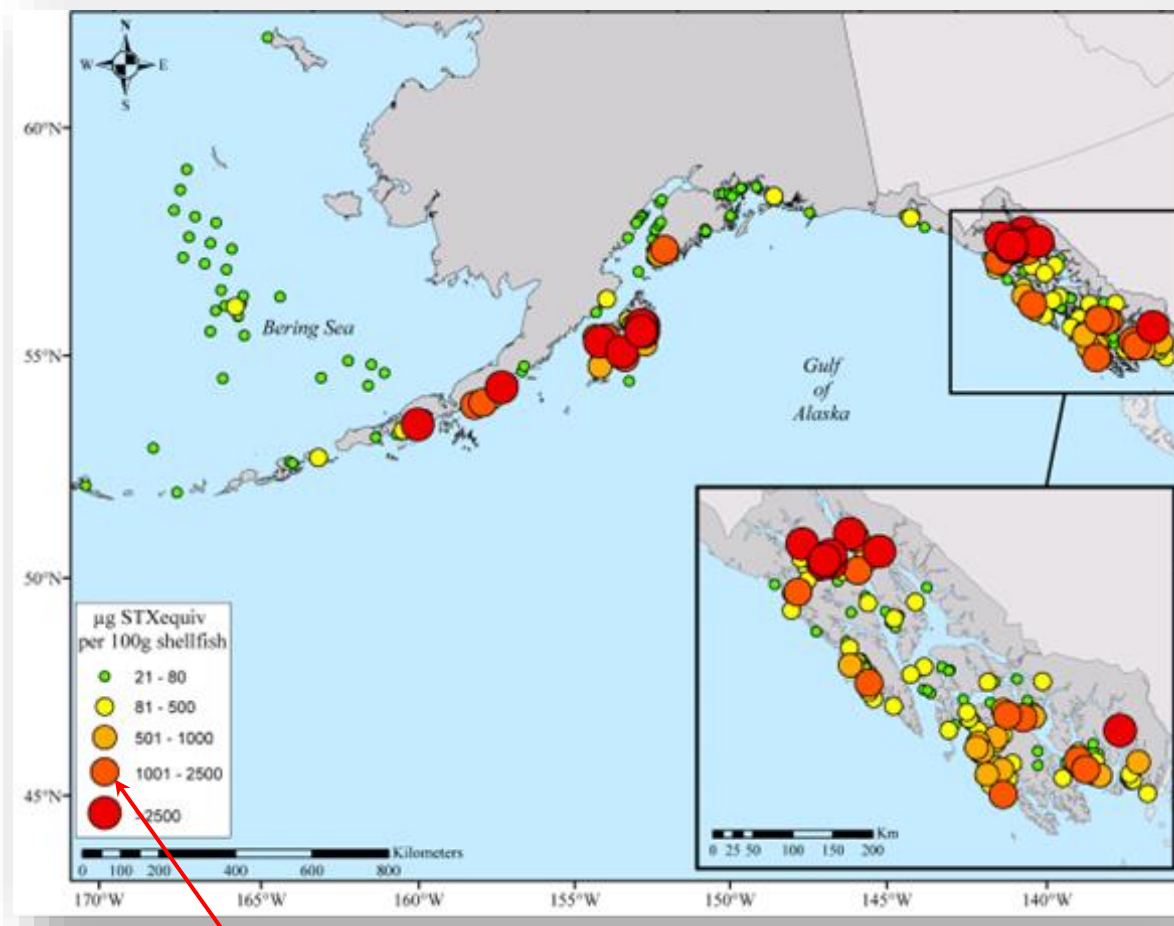

Paralytic Shellfish Poisoning

- *Alexandrium* species
- Saxitoxins (>20 forms)
- Potent neurotoxins

Effects

- Human illness, only place US results in death
- Shellfish closures
- Economic burden
- Marine mammals & seabird mortality?

Potentially lethal > 500 μg STX equivalents per 100 g shellfish

Partners

NOAA Beaufort Laboratory, NC

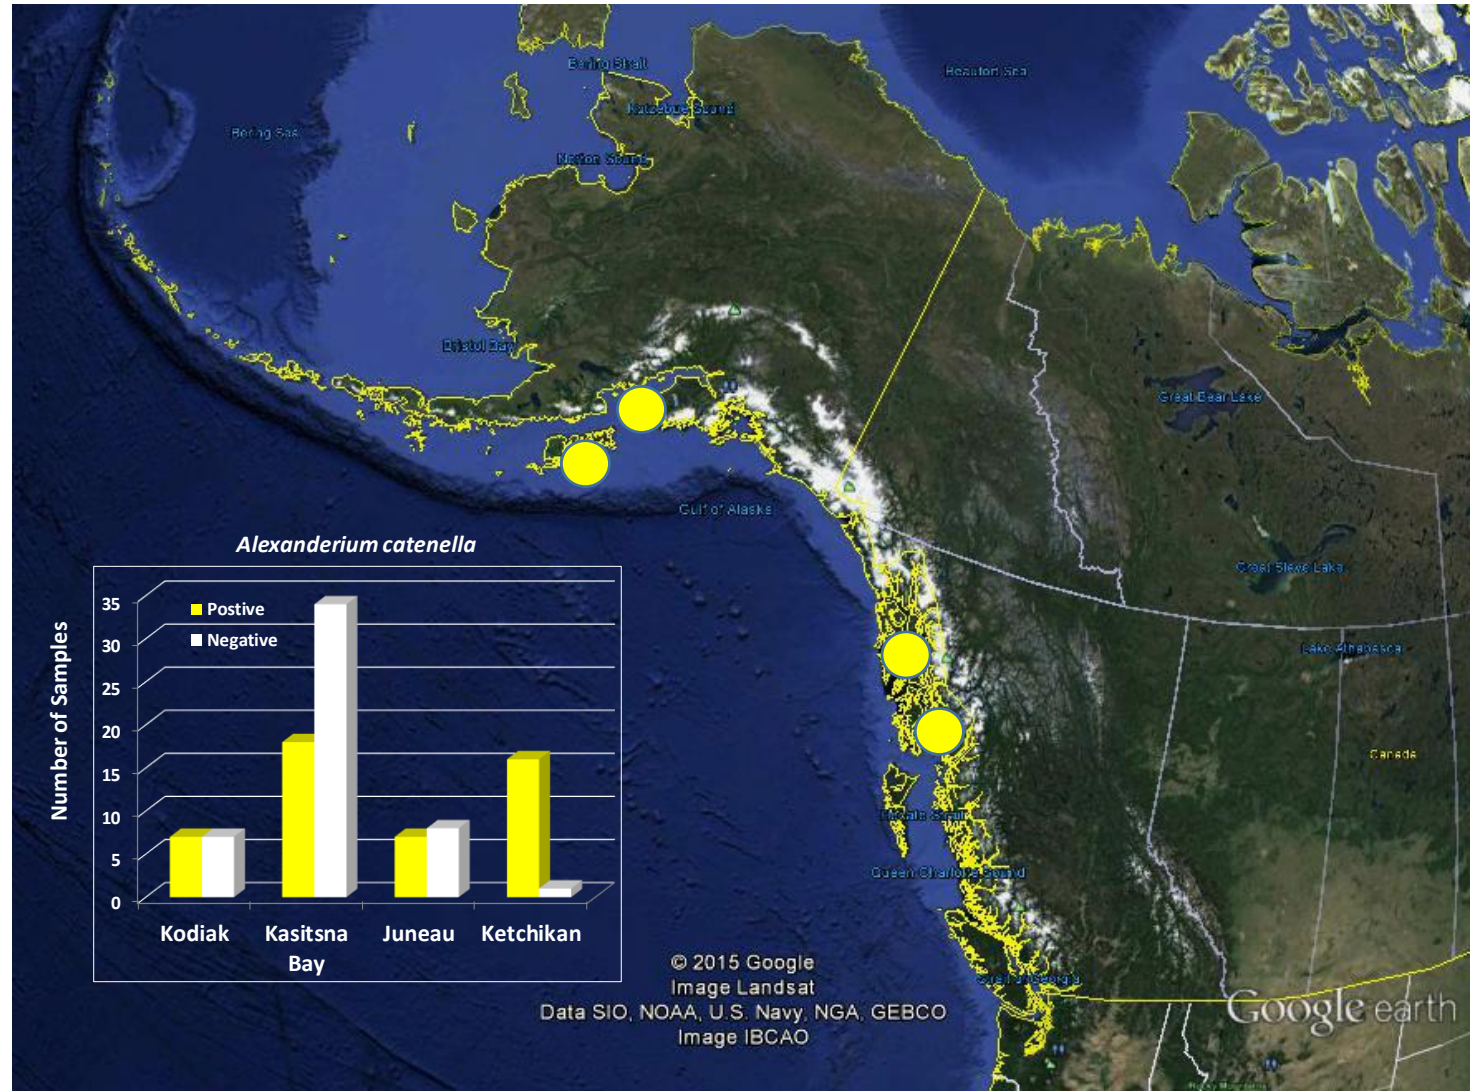

NOAA Kasitsna Bay Laboratory, AK

We Developed Methods for Mapping & Detection Toxic Species in AK

- *A. catenella**
- *A. ostenfeldeii*
- Developed species-specific qPCR assays
- Widely distributed

Distribution & Abundance of *Alexandrium catenella* in Kachemak Bay & Lower Cook Inlet

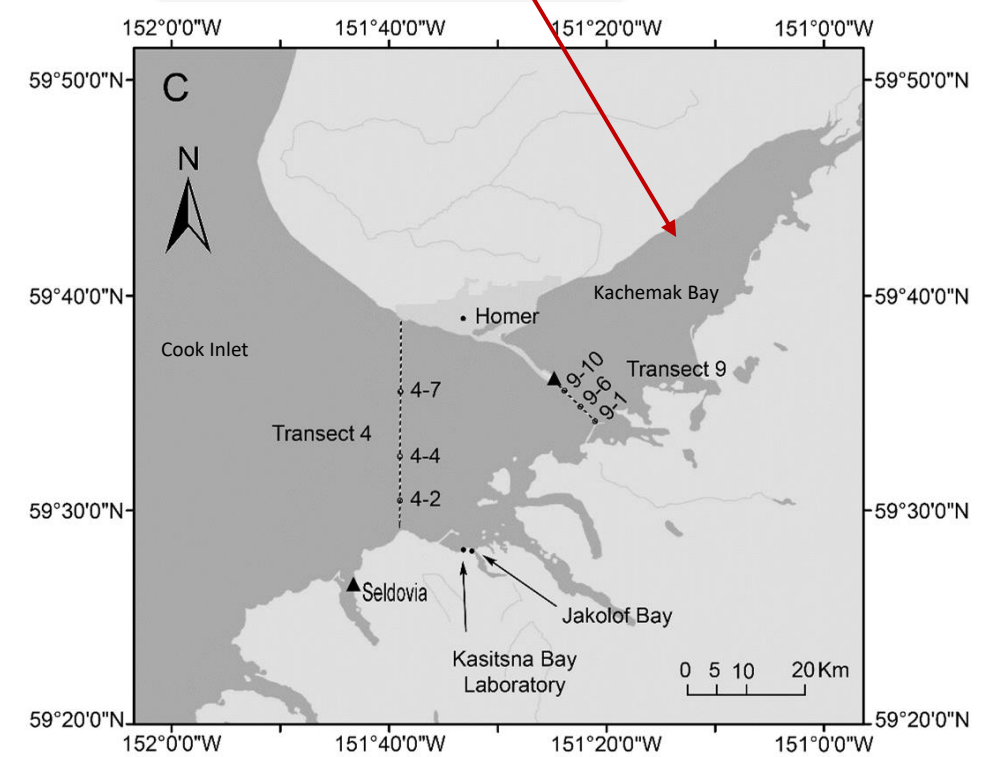

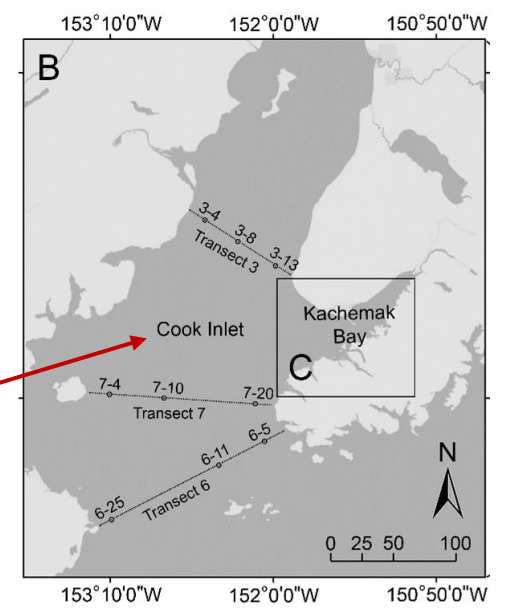

Objectives:

Use qPCR assay to:

- Characterize distribution & abundance
- Document local bloom seasonality
- Governing environmental factors

2012 – 2016

During North Pacific warming event

Seasonal *Alexandrium* bloom cycle

- Allows estimated risk
- Lets multiple user groups post toxicity data real time
- Direct link to customers

Nitrate + Nitrite

Ammonium

Phosphate

Chlorophyll

Alexandrium

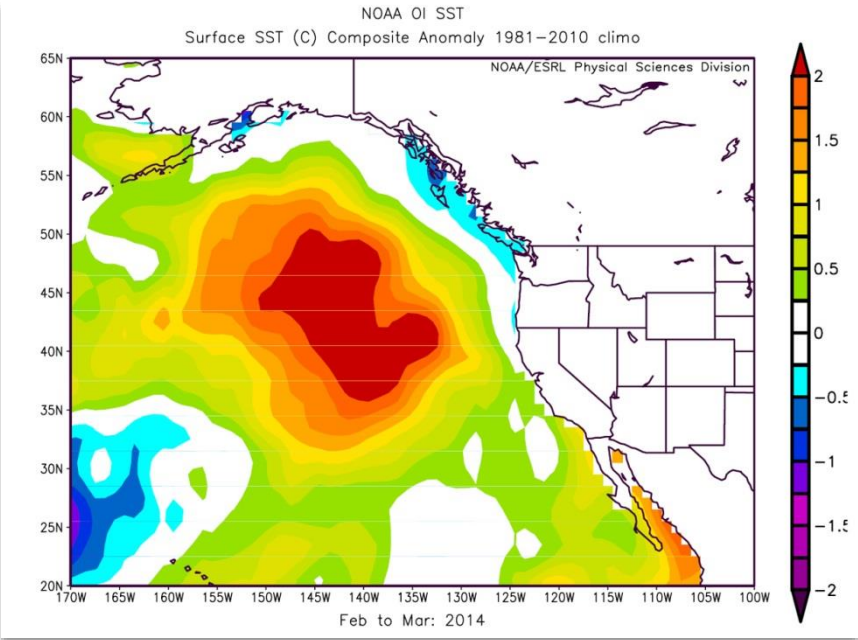

Alexandrium blooms Kachemak Bay

- Start April - May
- After main phytoplankton bloom
- Peak in Aug-Sep (Temp.)
- Nutrients not limiting

Other Drivers ?

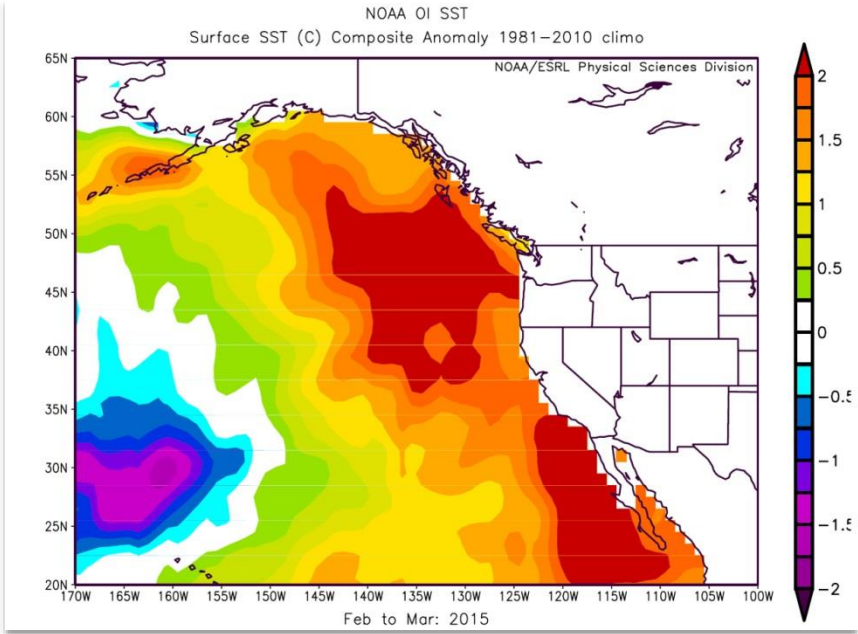

- Hydrodynamics
- Cyst beds
- Grazing

2014

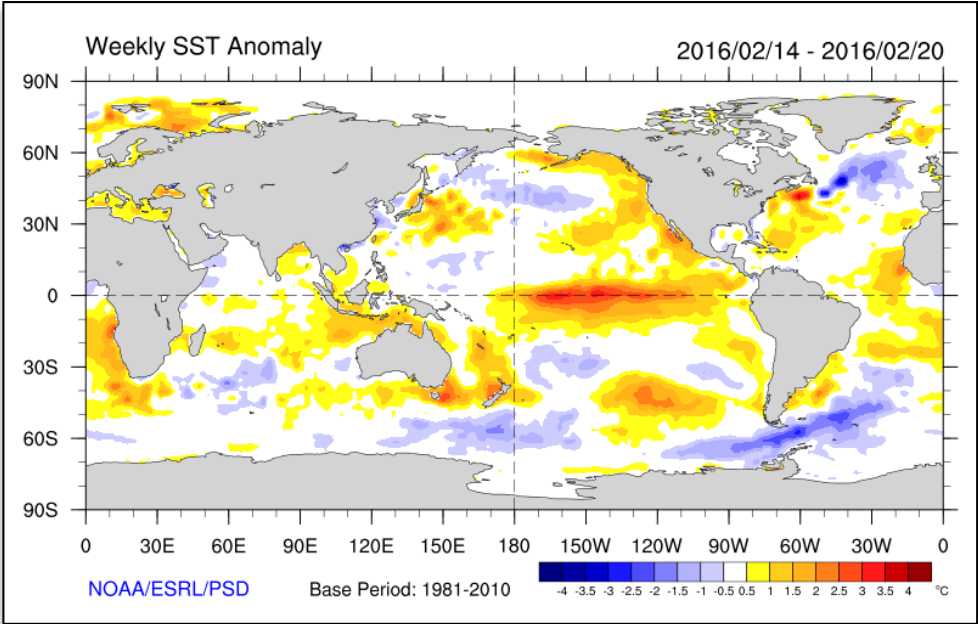

The warm water blob

2015

2016

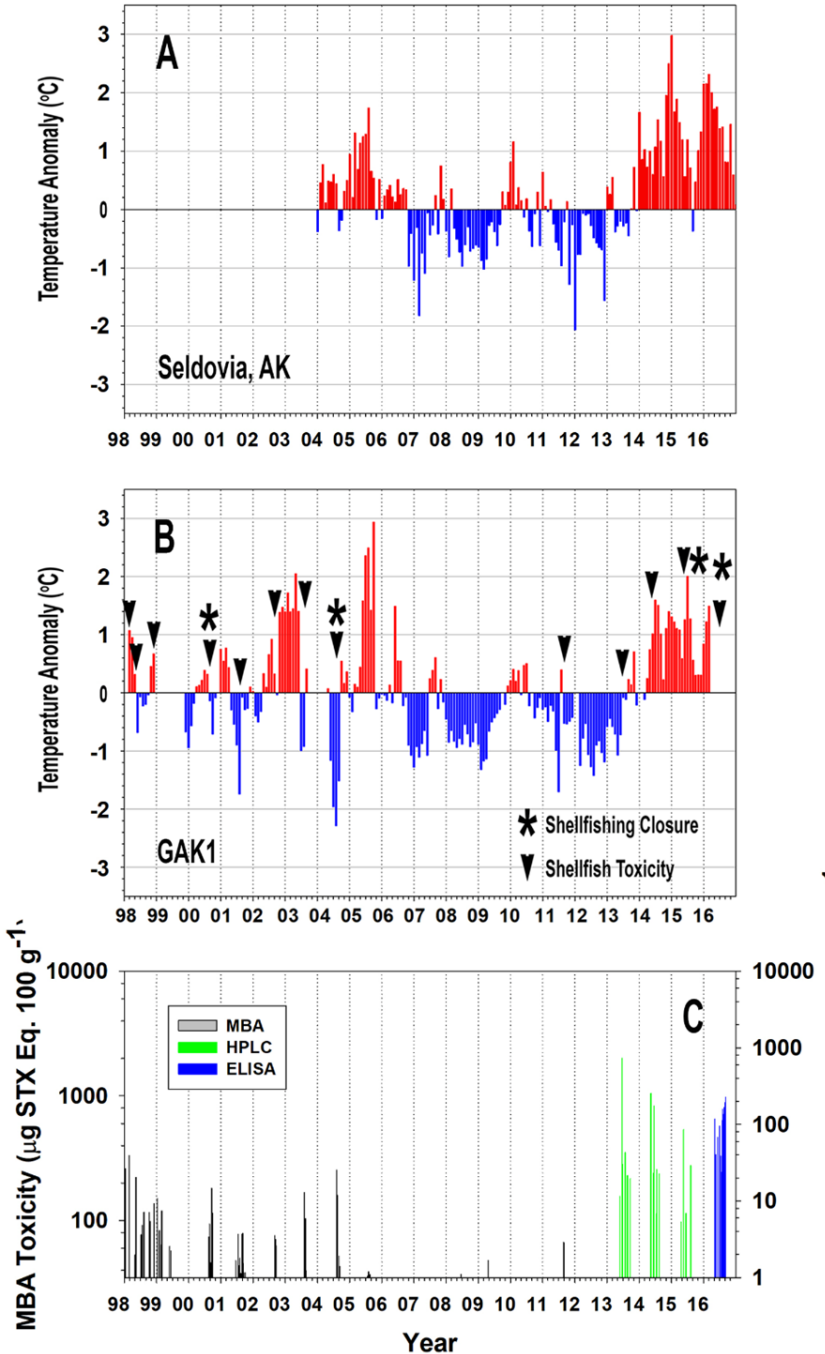

Regional Warming vs Bloom Intensity

***Alexandrium* response to increase in temperatures over course the study**

Temperature anomalies and PSP Risk

- $>0.5 - 1^{\circ}\text{C}$ temperature anomalies associated with increased toxicity and closure shellfish beds in K-Bay
- Means small changes temperature significantly increase risk PSP

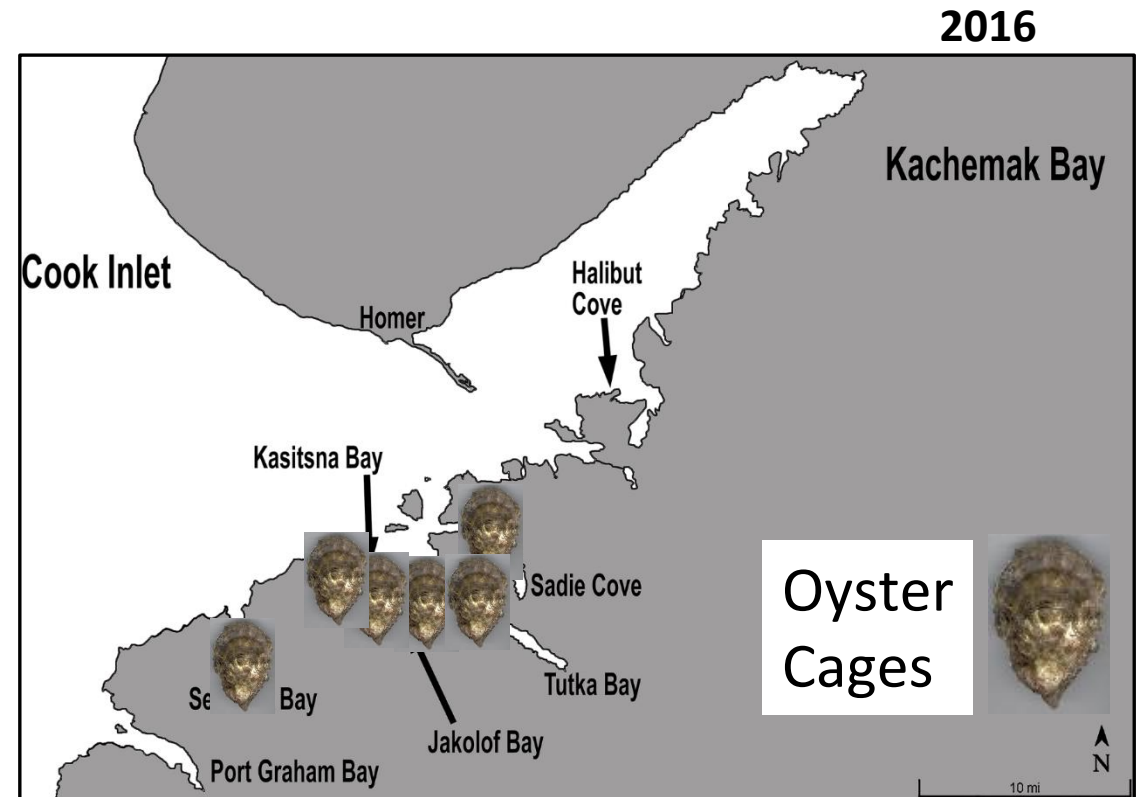

FY14 and FY16 Portfolio Project: Risk Assessment in Kachemak Bay

Objectives

- Improve HAB Monitoring and identify environmental drivers of *Alexandrium* abundance.
- Test bagged shellfish as monitoring tool.

Toxicity
Monitors

Used mussels and oysters as sentinel species

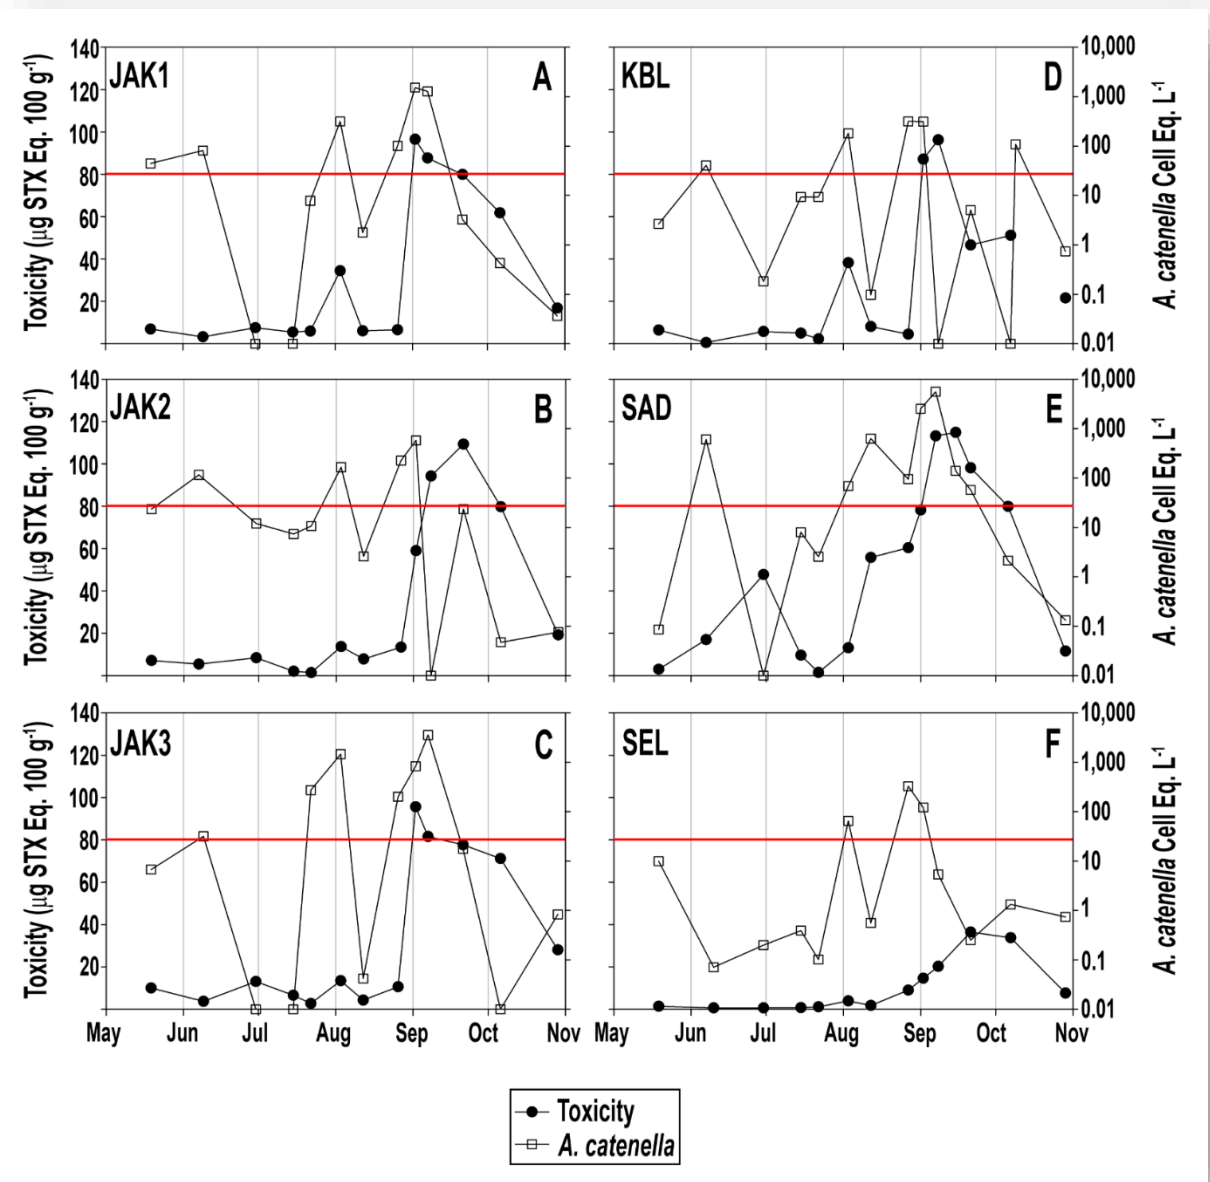

2016

2014

- 100 *Alexandrium* cells L⁻¹ toxicity increases substantially
- ~500 (400 – 600) *Alexandrium* cells L⁻¹ toxicity increases above regulatory limits

Rapid Test Kit Testing in Old Harbor, Ouzinkie and Kodiak City

SeaTox Research Inc

Measure 5-10 minutes, easy to run with minimal training

Train shellfish sampling groups in Kodiak Communities for monthly sample collection of Butter Clams in Old Harbor, Ouzinkie, and Kodiak City.

- Project kickoff workshop – Aug 2016
 - Ouzinkie, Old Harbor site visits
 - Coordination of sample collection
 - Receive samples & ship to Beaufort Lab for analysis

Slated to go out twice this year to do more training, particularly with respect to the tissue study described next.

*Modified Copernicus Sentinel data processed by EUMETSAT, Sentinel 3 L1b, sample data was produced and used for this work, in support of Sentinel 3 evaluation

Develop Habitat Model

- Blooms can be hard to distinguish
- FY18 activities
 - Provide satellite imagery to states and universities
 - Collect spectral data to improve satellite algorithms
 - Conduct lab culture studies needed to improve algorithm development
 - Imitate development habitat based model to identify blooms

Stakeholders

- VIMS, VA and MD State Departments of Environmental Quality

Blooms occurring in upper Chesapeake Bay

HAB Monitoring in NC

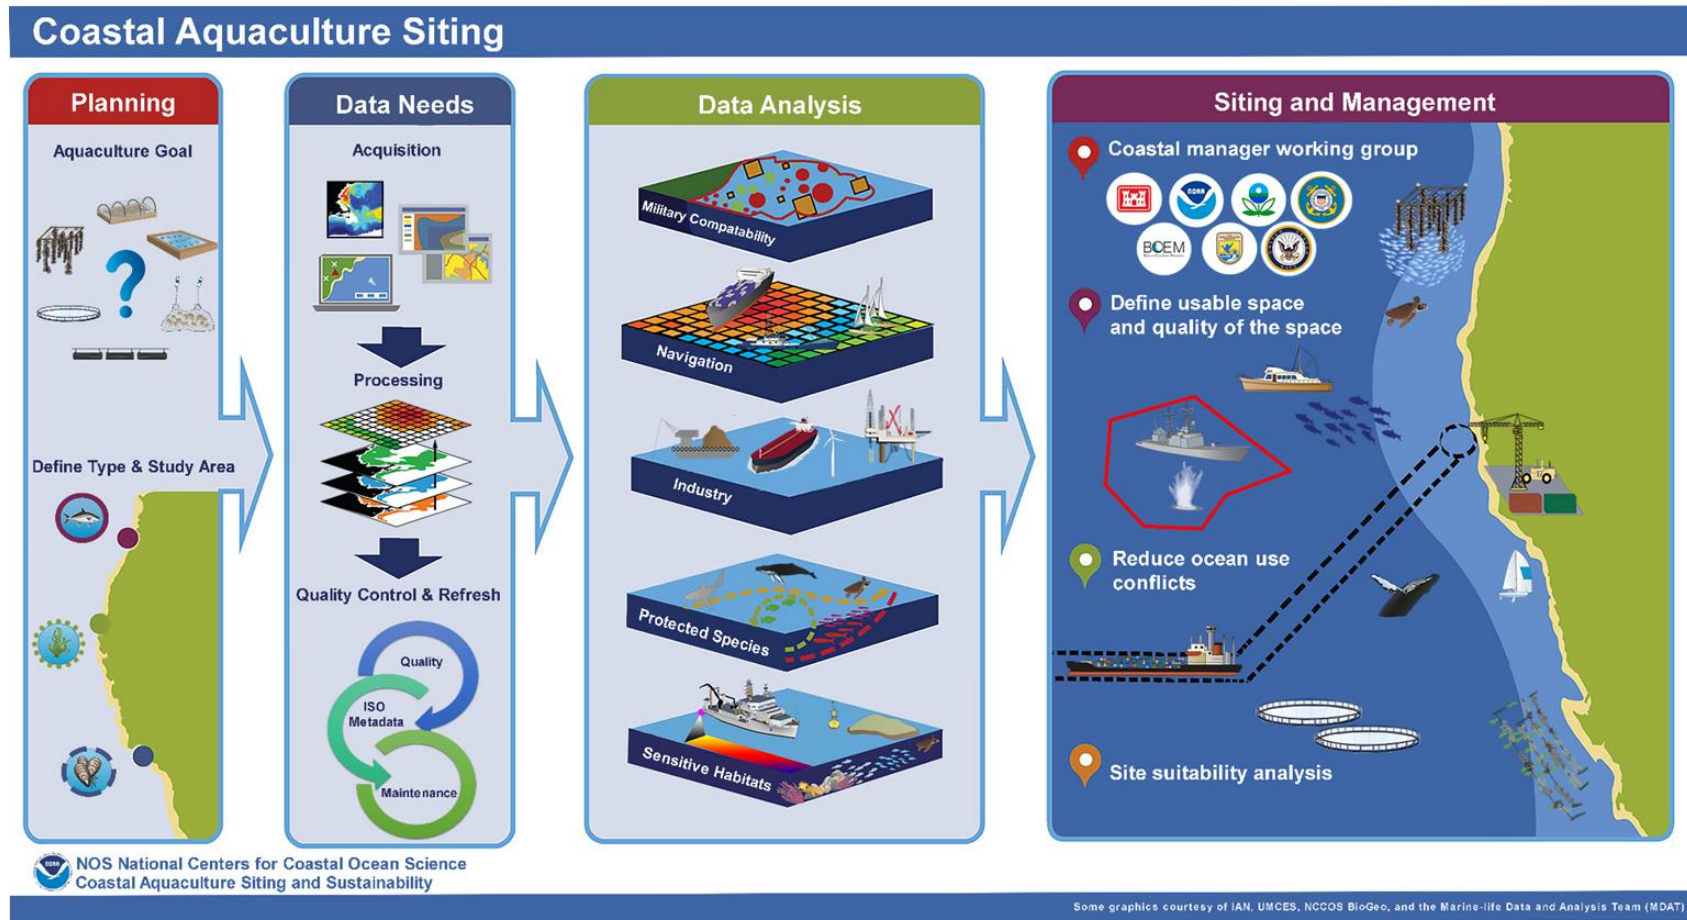

- Provide imagery to stakeholders in Albemarle Sound, NC
- Collaborate with NCSU on testing passive sampling devices for toxins
- Develop web site automatically delivers these data to the public

True Color Image

HAB Layer for National Aquaculture Planning Tool

- HABs can devastate offshore aquaculture facilities
- Crucial that HAB information is included in National Plan

HAB Monitoring & Reference Branch Overview

NAO 216-115A: RESEARCH AND DEVELOPMENT IN NOAA: Section 3.08

Accountability: NOAA's R&D will be regularly evaluated and adjusted based on objective reviews.

John Ramsdell, Branch Chief

QUALITY

A measure of soundness, accuracy and reproducibility of a specific body of research

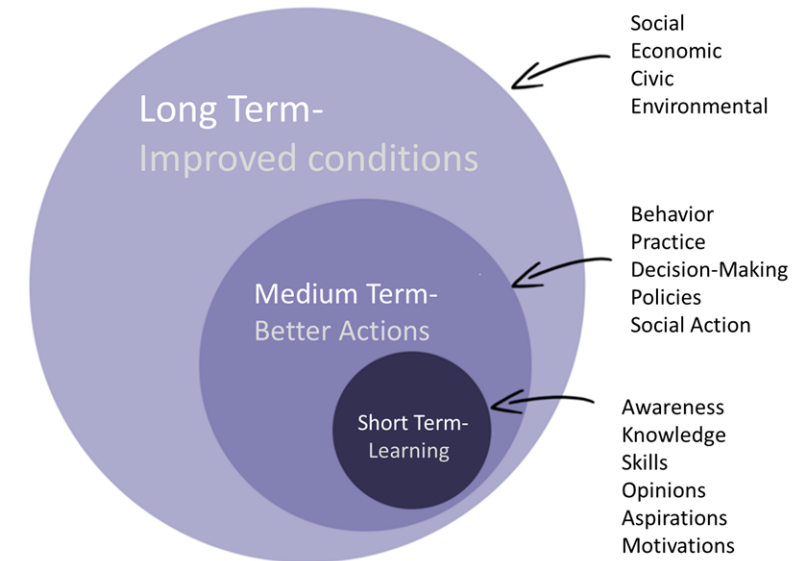

PERFORMANCE

An ability to manage to produce identifiable results, both effectively and efficiently

RELEVANCE

In essence this criterion asks for “what would not have happened if NCCOS did not exist, and how much would society have missed?”

A Federal Program on Maine Biotoxins Since 1992

HARMFUL ALGAL BLOOM AND HYPOXIA RESEARCH AND CONTROL ACT OF 1998
R E P O R T
OF THE
COMMITTEE ON COMMERCE, SCIENCE, AND TRANSPORTATION
on
S. 1480

"Before 1992, the Federal government did not expend much direct effort on HABs. Some funding was spent on a case-by-case basis if a new HAB occurred, but there was neither a pro-active orientation, nor a significant ongoing program dedicated to the HAB problem. Overall, federal funding levels were very low relative to the scope, complexity, and importance of HABs. As concerns about the problem increased in the 1990's, the Federal government began to devote greater attention to HABs. In 1992, NOAA sponsored a workshop with the HAB research community to develop a National Plan.

The workshop yielded a national research agenda and the creation of a Marine Biotoxins Program in NOAA."

Why an Intramural Research Program

The purpose of an intramural research program is to conduct, in government laboratories, distinct, high-impact research that cannot be readily funded or accomplished in traditional academia.

Such as work that:

- addresses emerging public health issues or threats;
- requires quick mobilization of existent capability and resources;
- requires the cooperation of local, state, tribal, or international governments;
- requires validation to meet regulatory standards;
- assures transition of research to application.

NOAA's Intramural Research

Where NOAA Invests in Research

NOAA maintains both intramural and extramural research investments.

Some programs invest the majority of their R&D funding internally, at labs and science centers with federal employees. Other programs invest the majority of their funding to external R&D partners, at universities, industry, and other research institutions.

Rick Spinrad
NOAA's Chief Scientist
2012-2017

NOAA Administrative Order (NAO) 216-115A

provides the principles around which the determination should be made about where to invest research funding based on the expected time to maturity of research investments.

- Internal investments allow direct engagement between the users and researchers.
- External investments allow flexibility and 'course-corrections' through grants and contracts.

An Intramural Research Program Prioritizes to Changing National Needs

OVERVIEW

Marine Biotoxins and Harmful Algae: A National Plan

- Isolate toxins, characterize structures and action
- Develop specific tests for toxins
- Develop forecasting capabilities
- Determine source and fate of toxins in food webs
- Develop management and mitigation strategies
- Improve databases for HAB events
- Develop communication programs
- Provide rapid response to toxic outbreaks

- Improved detection of HAB toxins and species
- Improved monitoring and forecasting
- Improved protection of human health
- Improved protection of endangered species
- Improved prevention and mitigation strategies
- Improved economic cost estimates of HAB events
- Improved economics for shellfish safety
- An educated and informed public

HABHRCA Act of 2014 requires NOAA under sec. 603A(f) to: Increase the availability to appropriate public and private entities of (A) analytical facilities and technologies, (B) operational forecasts, and (C) reference and research materials;

Work cooperatively and avoid duplication of effort with other offices, centers, and programs within the National Oceanic and Atmospheric Administration, other agencies on the Task Force, and States, tribes, and nongovernmental organizations to coordinate HAB and hypoxia activities and research.

An Intramural Research Program Prioritizes to Changing Organizational Requirements

OVERVIEW

Phytoplankton Monitoring Network

Human Observation

Sensors

Autonomous Observation

Develop more smaller more versatile technologies and expand customer accessibility to monitoring data and capacity for utilization

Analytical Response Team

Analytical Methods and Reference

Technology Transfer

Genomics

Toxicology

Advance existing NCCOS expertise in concert with other federal agencies participating in the HABHRCA to support the development of standardized methods and training for testing laboratories and validation of their use to assure accurate and reproducible measurements.

Close program on animal models for HAB disease and toxicokinetics

Program transferred to support OR&R needs for DWH NRDA

An Intramural Research Program Tracks to the Strategic Plan

NCCOS will focus its efforts by providing forecasting and detection products that empower communities to take action on HAB issues

Purpose

The NCCOS HAB sub-priority strategically supports NOAA responsibilities described in Section 603A(f) of HABHRCA. The National Science and Technology Council Subcommittee on Ocean Science and Technology's Comprehensive HAB and Hypoxia Research Plan and Action Strategy outlines Federal agencies' roles and responsibilities, identifies challenges, and recommends actions to address these events.

Over the next three to five years NCCOS will specifically focus on the following priority areas:

FOCUS AREA 1: Early warning forecasts of HAB extent, trajectory, and toxicity, so managers can implement early action (e.g., changes in water treatment protocols, targeted closures of certain fisheries or shellfish harvests) to more (cost) effectively and efficiently mitigate the impacts of HABs;

FOCUS AREA 2: Scenario predictive models of HAB abundance and toxicity that establish their relationship to causative factors, to improve management strategies for preventing and mitigating HABs and their ecosystem (including socioeconomic) impacts, and assess the effectiveness of prevention and control practices;

FOCUS AREA 3: Volunteer observation opportunities through the Phytoplankton Monitoring Network human infrastructure to educate citizens, test new technologies, and inform managers of the onset of toxic bloom events; **STEVE MORTON: 1:00 PM Today**

FOCUS AREA 4: New detection technologies, such as test kits, autonomous sensors, and portable field instruments that enable local observations to support operational and demonstration forecasts, and provide states, municipalities and tribal nations with the ability to identify and quantify HAB species and toxicity;

GREG DOUCETTE: 1:20 PM Today

FOCUS AREA 5: Analytical methods and reference materials which leverage existing NCCOS expertise, will be advanced in concert with other federal agencies participating in the HABHRCA IWG to support the development of standardized methods and training for testing laboratories and validation of their use to assure accurate and reproducible measurements nationwide. **MAGGIE BROADWATER: 1:40 PM Today**

HAB Monitoring and Reference Branch- Quality Measures

A measure of soundness, accuracy and reproducibility of a specific body of research

Rigour - A certain level of experience and training that provides an appropriate level of circumspection.

Reproducibility - The use of multiple approaches to address a question.

Routine - The management of quality.

Robustness - That which is credibly inferred from the application of our findings.

Rigour - A certain level of experience and training that provides an appropriate level of circumspection

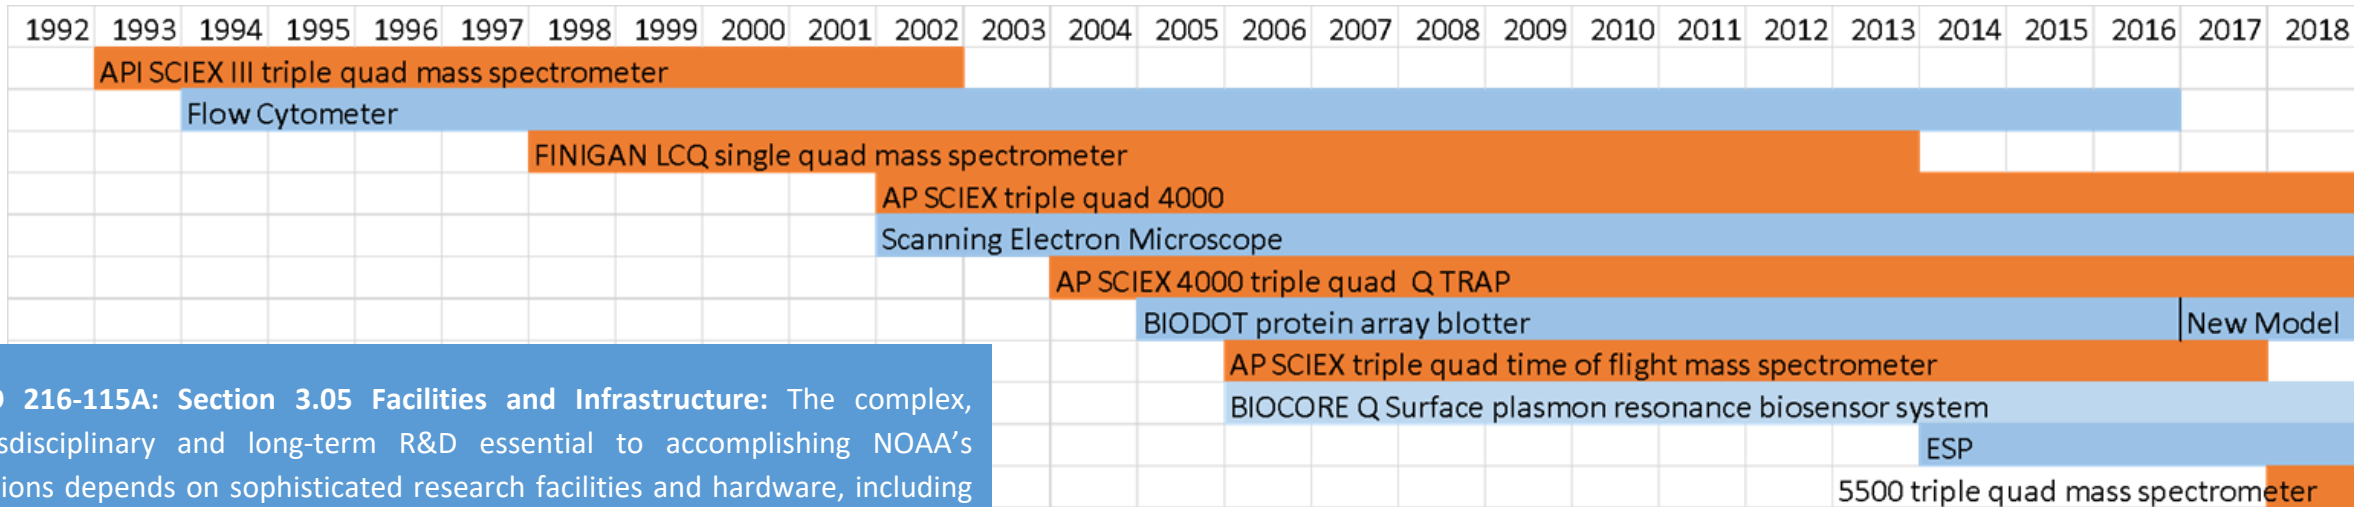

Expert- No longer relies on rules, guidelines or maxims. Intuitive grasp of situations based on deep tacit understanding. Analytic approaches used only in novel situations or when problems occur. Vision of what is possible. Has an authoritative or deep holistic understanding, deals with routine matters intuitively, able to go beyond existing interpretations, achieves excellence with ease. Dreyfus, S E (1981) Four models v human situational understanding: inherent limitations on the modelling of business expertise USAF Office of Scientific Research, F49620-79-C-0063.

Analytical equipment and specialized laboratories. A fleet of mass spectrometers, high resolution microscopes and sensing platforms is expertly maintained by our scientific staff to maintain peak performance and lifespan.

NAO 216-115A: Section 3.05 Facilities and Infrastructure: The complex, transdisciplinary and long-term R&D essential to accomplishing NOAA's missions depends on sophisticated research facilities and hardware, including laboratories, instrumentation, ships, aircraft, satellites, moored platforms, autonomous vehicles, high performance supercomputing, test beds, proving grounds, data repositories, computer models and information systems

Reproducibility - The use of multiple approaches to address a question.

QUALITY

Several studies across many fields estimate that only around 40% of published findings can be replicated reliably

Routine - The management of quality.

QUALITY

Toxin Analysis Management Team (TAMT)

This team is a multidisciplinary group of scientists who determine what analyses, if any, any will be performed and to assign staff responsibilities. The TAMT also assures all final reports for quality and accuracy prior to its release to the originator of the request.

The S&R design and success of the Analytical Response Team in defining the cause of marine animal mortality events drew the attention of the IBM Advanced Business Institute (ABI) Stephen Haeckel, Director of Strategic Planning, familiar with red tides as a coastal resident an authority on sense and respond business design, and author of “Adaptive Enterprise” (Harvard Business School Press, 1999). Mr. Haeckel and worked with the team to design to TAMT.

The largest S&R implementation to date is a multi-billion dollar systems integration project involving 3,000 people. The smallest is a seven person organizational design for responding to what the United States National Oceanic and Atmospheric Administration calls “coastal mortality events.” - Stephen Haeckel

Published in 2016 the Workbook features the NOAA Team as one of three case studies

Routine - The management of quality.

QUALITY

2001 LEIGHFIELD

2006 FIRE

2014 BROADWATER

TAMT Meeting Participants: Maggie Broadwater, Tod Leighfield, Steve Morton, Zhihong Wang, John Ramsdell, Bennie Haynes, Wayne McFee, Peter Moeller, Greg Doucette
 18 December 2017 Absent:

Agenda

Projects/Research	
DSP Shellfish (Zhihong)	Need calibrating standards (AZA, DSP). In-matrix RM, vs. calibrant RM. 5 species -- high recovery in mussels -- differences among species and locations FDA (Jon Deeds) - ISSC method used East coast shellfish; we are seeing issues with WA shellfish. Potential solution: tiered analysis with support from federal labs? Screening/confirmation. Project has another year. NRC: Mussel only -- OA, DA, PSP
Ohio EPA RBA Tech transfer (Greg)	Award has been made (Heather Raymond, OH EPA) Indirect funding for materials & supplies via BGSU (Davis). Jan 1 start? JR: EPA interest in collaborating via MOU; EPA funds or supplies monitoring. Also support new methods and RBA for freshwater samples. Can support Fed work on freshwater samples. New scintillation counter to support this project?
NIST Geoduck clam reference material (Tod/Zhihong)	PSP (RBA), DSP (LC/MS), and maybe DA (LC/MS). Under analysis for As. 480 jars @ 12g ea. Shelly L. communicating with users. PSP RBA: "reference value" (1 lab) vs. "certified value" (3 labs). Note NIST definitions may differ from NRC. TL: suggest reference values on 3 toxins DSP - follow ISSC method for PSP, DSP toxins DA - reference publications Funding for DA, DSP?
PM Discretionary project	Discuss in Jan TAMT. LC/MS, bioassay access or support? Need to measure toxins released during process? Mcx Single quad LC/MS, PDA detection, vs. EPA ELISA method. MC-LR, MC-RR, need total toxicity -- Abraxis ELISA. Time course, ~ 30 samples. Need ~ 6 plates. Greg replacing used kit.

Announcements	
TAMT	Monthly -- 2pm on the 3rd Monday (except MLK, Pres)
HML Power outage	Tomorrow
Shutdown Preparation?	Friday -- nothing for now
Holiday schedule	Peter, Jenn, JR on Wed/Thurs Tod to check with Greg W re: HVAC in 227.
Records Management Training	Due Dec 31
STEMFest	Brittlebank Park, Feb 3 Contact: Steve, Sean Morton
HAB/Hypoxia Science Review	Feb 26-28 in Silver Spring
NOAA Research Council (Tod)	1 year task force to examine "research small infrastructure" (lab/field equipment and maybe small boats). JR: how can we recover funds for replenishing infrastructure. Ref: NIST Amortization scheme to move forward, replace. Inventory, mechanisms going forward.
EPA Film Crew (Kevin Hollerbach)	Possibility of EPA sponsored film crew to outline how PMN interfaces with ART and toxin detection Film crew may video sample ID, toxin detection, etc. Potentially Sitka also.
Travel	
Maggie	GoMRI VI PI Meeting Feb 20-23
John and others	Silver Spring Feb 26-28
Steve	Note: Add Sitka travel to travel sheet.

Discussion	
IAEA/Tech transfer (Tod)	Training: IAEA Fellow from Kenya?
AK Collaborative work	May workshop
(Tod/Steve)	Mar/April - Sitka people visiting Chas for training
PMN (Steve)	AOP freshwater milestone (~ 22 PMN fw sites)?
Facilities & safety (Bennie)	Lab safety inspections due COB today Facilities issues - new track-it system. Major issues with State responsibilities for CCEHBR building. BH: email JR with lighting issues.
Sensors (Greg)	Mcx assay for 3G ESP (SPR method - Tina)] Addressing logistical issues in Lake Erie Faisal - volunteer position half-time? Assays (DSP, PbTx)
LC/MS Instrumentation (Tod/Zhihong)	All ok
Purchasing	Multi-year service contracts expiring Mar. TL: speak with Ed. Combining CCEHBR & HML. Need to sync dates going forward.

Robustness - That which is credibly inferred from the application of our findings.

QUALITY

Northern Gulf of Mexico Bottlenose Dolphin Unusual Mortality Event Algal Toxins Report

Date: 15 January 2014

Documented by: Maggie Broadwater

NOAA National Ocean Service, Marine Biotoxins Program
219 Fort Johnson Road, Charleston, SC 29412
(843) 762-8535 <maggie.broadwater@noaa.gov>

A. Suspected Event and Sample Details

Liver (n = 83) and fecal (n = 39) samples from 83 Bottlenose dolphins (*Tursiops truncatus*) stranded in the Northern Gulf of Mexico from March 2012 to March 2014 were submitted to NOAA Marine Biotoxins Program. Samples were assigned NOS ID numbers (NG141-264) upon receipt in prep for toxin extraction and analysis. A complete sample list is given in the data summary below (section F).

B. Findings

Brevetoxins were observed in feces (161 ng/g) from one animal stranded near Orange Beach, AL in October 2013. Domoic acid was detected levels (trace – 6 ng/g) in feces from three animals, stranded in Alabama (n = 1) and Louisiana (n = 2) from February 2012 – March 2014. Okadaic acid was detected in liver (n = 6, trace – 0.8 ng/g) and feces (n = 1, 0.7 ng/g) from seven animals, stranded in Alabama (n = 1) and Louisiana (n = 6) between June 2010 and March 2014. Two animals were concurrently exposed to multiple toxins: brevetoxins (161 ng/g) and domoic acid (that observed in feces from 26DISL101713, stranded near Orange Beach, AL in October 2013, and domoic acid (6 ng/g) and okadaic acid (0.7 ng/g) observed in feces from JDM-20140310-LA001, stranded near Golden Meadow, LA in March 2014. Complete results are presented in Table 1 and Figures 1-3 (section F).

C. Brevetoxin (PbTx) Analyses

1. Preparation of Samples: Samples (~ 2 g) were homogenized and extracted three times in 3 volumes of acetone, filtered (0.45 µm Acrodisc filter), evaporated, resuspended in 80% aqueous methanol (6 mL), twice solvent partitioned with hexane (3 mL), and the methanolic fraction collected, evaporated, and resuspended in 100% methanol (1-2 mL). Extracts were stored at -20°C until analysis. Samples were prepared for analysis by B. Briggs.

2. ELISA Methods: Extracted samples were analyzed using a direct competitive enzyme-linked immunosorbent assay (ELISA) for PbTx, following methods outlined by Maucher *et al.* (2007). The ELISA utilizes cross-reactivity of PbTx to anti-PbTx antibodies to determine PbTx-like activity in sample. Quantitation is determined via competition between PbTx in the sample and PbTx conjugated to a signal enzyme for binding to anti-antibodies. Analyses were conducted by Maggie Broadwater.

3. ELISA Results: Brevetoxin-like activity was detected in 11 of 112 samples analyzed. The limit of detection for this assay was 2.0 ng PbTx per sample.

4. LC-MS Methods: ELISA-positive samples were cleaned on C18 solid phase extraction cartridges (Agilent) and analyzed by liquid chromatography/mass spectrometry (LC-MS) for parent brevetoxins and metabolites. Liquid chromatography separations were performed on C8(2) 150 × 2 mm column using an Agilent Technologies Model 1100 LC system. Mobile phase consisted of water and acetonitrile with 0.1% formic acid additive with gradient elution. The mobile phase flow rate was 0.2 mL/min. The eluant from LC was analyzed by an AB Sciex 4000 QTRAP triple quadrupole/linear ion trap mass spectrometer equipped with a TurboV™ interface. The analysis of brevetoxin congeners and metabolite mass spectrometry was achieved by multiple reaction monitoring (MRM). Toxin congeners monitored included: brevetoxin-B(A), dihydrobrevetoxin-B(A), tetrahydrobrevetoxin-B, hydrolysis product of dihydrobrevetoxin-B(A), hydrolysis product of oxidized brevetoxin-B, brevetoxin-B2, S-desoxybrevetoxin-B2, cysteine conjugates of brevetoxin-A. Detection limits were 0.25, 1.4, and 1.2 ng/ml for dihydrobrevetoxin-B, S-desoxybrevetoxin-B2, and brevetoxin-B2, respectively, with signal-to-noise ratio slightly above 3. Standards were prepared in methanol. Retention time of other toxin congeners was determined by injecting an algal extract with known toxin congeners. Toxin congeners positive by MRM scan were also examined by enhanced product ion spectra for further confirmation. LC/MS analyses were performed by Z. Wang.

5. LC-MS Results: Brevetoxin congeners (dihydrobrevetoxin-A, dihydrobrevetoxin-B, S-desoxybrevetoxin-B2, and brevetoxin-B2) were detected LC-MS in feces from 26DISL101713 (NOS ID NG159), stranded near Orange Beach, AL in October 2013. Brevetoxins were not observed in the ELISA-positive samples.

D. Domoic Acid (DA) Analyses

1. Preparation of samples: Samples (~2 g) were extracted by adding four volumes of 50% aqueous methanol to the sample volume, homogenizing, and then probe sonicating on ice for 2 min. Extracts were centrifuged at 3400 x g, and the supernatant collected and filtered (0.45µm, Acrodisc syringe filter) prior to analysis. Sample clean-up was performed by solid-phase extraction (SPE) using Agilent 200 mg C18 columns. Samples were prepared for analysis by Bennie Haynes.

2. LC-MS Methods: The methanolic extracts were analyzed for the presence of domoic acid using tandem mass spectrometry coupled with liquid chromatographic separation (LC-MS/MS) by Dr. Zhihong Wang, following methods described in Wang *et al.* (2012). This method utilized reversed phase chromatography, using an Agilent 1100 HPLC coupled to an AB-SCIEX API-4000 triple quadrupole mass spectrometer in ESI+ mode. Chromatographic separation was performed on a Phenomenex Luna C18(2), 5µm, 150 mm x 2 mm column. Mobile phase consisted of water and acetonitrile with 0.1% formic acid as an additive. Retention time of DA in samples was determined based on the retention time observed with a certified DA reference standard from the Institute for Marine Biosciences, NRC Canada (Halifax, NS). The detection of domoic acid by MS was achieved by Multiple Reaction Monitoring (MRM) method with Turboionspray interface. Four MRM transitions from protonated domoic acid were monitored: m/z 312 → 266, m/z 312 → 248, m/z 312 → 193, and m/z 312 → 161.

3. LC-MS Results: DA was detected in 3 of 89 samples analyzed; the three feces samples were from animals stranded in Alabama and Louisiana between February 2012 and March 2014. The detection limit was 2.5 ng DA per gram sample, with a signal-to-noise ratio above 3; the limit of quantification (LOQ) was 5 ng per gram sample, with a signal to noise ratio above 10.

E. Diarrhetic Shellfish Poisoning (DSP) toxins analysis

1. Preparation of samples: Samples (~ 2 g) were extracted by adding four volumes of 100% methanol to the sample volume, then homogenized and probe sonicated on ice for 2 min. Sample extracts were centrifuged at 3400 x g, and the supernatant was washed with hexane. Sample clean-up was performed on all extracts by solid-phase extraction (SPE) using Strata X polymeric reversed phase (30 mg, 1 mL) columns. Samples were extracted by Bennie Haynes; sample clean-up was performed by Dr. Zhihong Wang.

2. LC-MS Methods: Samples were analyzed for the presence of okadaic acid (OA), dinophysistoxins (DTX-1 and DTX-2), and pectenotoxin-2 (PTX-2) using liquid chromatography (LC; Agilent 1100 series HPLC, Palo Alto, CA) coupled with tandem mass spectrometry (MS; AB Sciex, Foster City, CA). For analysis of DSP toxins, LC separation was performed on an X-Bridge C18 (150 × 3 mm, 5 µm) column (Waters, Milford, MA) using a mobile phase of water (A) and acetonitrile/water (9:10, V/V) (B), both containing 6.7 mM ammonium hydroxide under gradient elution at a flow rate of 0.4 mL/min. Gradient elution was used to separate OA, DTX-2, DTX-1, and PTX-2: 32% B was held for 0.5 min, with a linear increase to 50% B at 9.5 min and then to 80% B at 10.5 min; 80% B was held for 6.5 min, increased linearly to 90% B at 17.5 min and held at 90% B for 3 min; mobile phase was returned to 32% B at 21 min and held for 7 min. Mobile phase was used within one week of preparation. MS detection was in multiple reaction monitoring (MRM) mode using a 4000 QTRAP mass spectrometer. OA and DTX-2 with MRM transitions of m/z 803.5 → 113.1 and 255.1; for DTX-1 with MRM transitions of m/z 817.5 → 113.1 and 255.1; for PTX-2 with MRM transitions of m/z 876.5 → 213.1 and 823.5). LC/MS analyses were performed by Dr. Zhihong Wang.

3. LC-MS Results: Okadaic acid was detected in 7 of 75 samples analyzed (six livers and one fecal sample) at levels from trace – 0.8 ng per gram sample. Dinophysistoxins (DTX-2 and DTX-1) and pectenotoxin-2 (PTX-2) were not detected in any of the samples. Detection limits were 0.4, 0.5, 0.4, and 0.3 ng/g for OA, DTX-2, DTX-1, and PTX-2, respectively. Limits of quantitation were 0.6, 0.7, 0.7, and 0.3 ng/g for OA, DTX-2, DTX-1, and PTX-2, respectively.

Federal Data Quality Act, NOAA Section 515 Information Quality Guidelines Pre-dissemination Review

The principal procedural requirements pertaining to quality of information disseminated by are set forth under the Federal Data Quality Act (Section 515 of the Treasury and General Government Appropriations Act for Fiscal Year 2001). NOAA Section 515 Information Quality Guidelines (NOAA, 2006) apply broadly to all information that the agency disseminates.

A key requirement of the Section 515 Guidelines is a “Pre-dissemination Review” that ensures the utility, integrity and objectivity of information released.

- I. Name/Title of information product:
- II. NOS Office/Division disseminating information product: NCCOS/
- III. Document how the following **standards for utility** are met by the information product:
 - A. The content of the information is helpful, beneficial, or serviceable to its intended users, or that information supports the usefulness of other disseminated information by making it more accessible or easier to read, see, understand, obtain, or use.
 - B. The data product is disseminated in a manner that allows it to be accessible and understandable to a broad range of users.
- IV. Document how the following **standards for integrity** are met by the information product:
 - A. All electronic information disseminated by NOAA adheres to the standards set out in Appendix III, "Security of Automated Information Resources," OMB Circular A-130; the Computer Security Act; and the Government Information Security Reform Act.
 - B. Confidentiality of data collected by NOAA is safeguarded under legislation such as the Privacy Act and Titles 13, 15, and 22 of the U.S. Code.
 - C. Additional protections are provided as appropriate by 50 CFR Part 600, Subpart E, Confidentiality of Statistics of the Magnuson-Stevens Fishery Conservation and Management Act, NOAA Administrative Order 216-100 – Protection of Confidential Fisheries Statistics.
- V. Document how the following **standards for objectivity** are met by the information product:
 - A. The data are collected according to documented procedures or in a manner that reflects standard practices accepted by the relevant scientific and technical communities.
 - B. Data collection methods, systems, instruments, training, and tools are appropriate to meet the requirements of the intended users and are validated before use.
 - C. NOAA's standard operating procedures (SOPs) are reviewed on a regular basis and modified as practices and procedures evolve. Deviations from current SOPs are documented and occur only if valid scientific reasons exist for such a deviation.
 - D. The data undergo quality control prior to being used by the agency or disseminated outside of the agency.
 - E. The quality control/quality assessment of NOAA data is an on-going process. Describe any applicable evolution and/or improvement in survey techniques, instrument performance and maintenance, and data processing.
 - F. NOAA strives for transparency regarding data collection procedures, level of quality, and limitations. Metadata record descriptions and explanations of the methods and quality controls to which original data are subjected are included or available upon request.

HAB Monitoring and Reference Branch- Performance Measures

PERFORMANCE

An ability to manage to produce identifiable results, both effectively and efficiently

The Commerce Alternative Personnel System (CAPS) links employee compensation to measures of work quality or goals. Performance pay increases are tied to performance appraisals and employees' rank within a pay pool, and are added to employees' basic pay. Bonuses are also linked to performance.

NCCOS 2018 Annual Operating Plan (submitted 10-7-17)

MILESTONE 1 | Coastal and Marine Spatial Ecology: Integrate and apply socioeconomic and biophysical information to improve multi-use planning in the Gulf of Mexico, Choptank Complex Habitat Focus Area, and Lake Michigan.

MILESTONE 2 | Stressor Detection and Impacts: Support OR&R in its mission of protecting NOAA trust resources from threats caused by oil spills, oil dispersants and other contaminants by determining oil toxicity on corals and in estuaries, and establishing baselines in the Arctic.

MILESTONE 3 | Social Science: Conduct social science research to support the Sanctuaries nomination process, BOEM wind energy planning, and to understand economic impacts of whale ship-strike reduction options on the shipping industry.

MILESTONE 4 | Ecological Forecasting: Enhance ecological forecasting capabilities for HABs to reduce respiratory illness hazard from Gulf of Mexico Red Tide, paralytic shellfish poisoning in Alaska, fish kills in aquaculture facilities, and to detect cyanobacterial blooms nationally.

MILESTONE 5 | Climate Resilience: Increase capacity for long-term coastal planning by improving tools and products for modeling impacts of sea-level rise and assessing vulnerabilities of marshes, dunes, and beaches to sea level rise and coastal storms.

MILESTONE 6 | HAB Detection Technologies: Validate and transition HAB detection and monitoring products to provide identification and toxicity measurements for regional observing networks, states, municipalities and tribal nations.

MILESTONE 7 | RESTORE: Address identified management needs and science gaps in the Gulf of Mexico ecosystem through a competitive awards process that drives scientists and resource managers to address challenges and apply the results.

DELIVERABLES REPORTABLE FROM INVESTIGATOR TO SUPERVISOR

1. Execute deployment of OAR-GLERL ESP for microcystin detection to span a significant portion of bloom season and generate near-real time data supporting development of Lake Erie toxicity forecasts (GLERL, NCCOS, CILER collaboration); 3rd and 4th Quarters, FY17;
2. Conduct multiple offshore deployments of NMFS-NWFSC ESP and CCEHBR DA sensor in PNW, and complete demonstration of near-real time data dissemination to managers and other stakeholders via NANOOS DVS (UW-NWFSC IOOS OTT project); 3rd and 4th Quarters, FY17;
3. Deploy surface plasmon resonance sensor for DA detection in Monterey Bay on Long-Range AUV-based 3rd generation ESP as part of first science mission for this observing technology (MBARI, U Maine, U Washington partners); 4th Quarter, FY17;
4. Conduct optimization of microcystin and PST sensors for ESP to improve the accuracy of toxin quantification for diverse algal assemblages and toxin profiles, and continue development of multiplexed DA-PST sensor for 2G ESP; all quarters, FY17.

1. Implement PMN platform for freshwater toxins through NOAA-EPA Agreement in high priority regions identified in FY17 EPA. **DELIVERABLE:** Utilize trip to EMD Workshop trip to Washington DC to meet with EPA Office to Water to update of the progress of the freshwater PMN in the first quarter;
2. Expand customer accessibility to HAB observations by enhancing data serving capacity and visualization of the PMN database in collaboration with the National Center for Environmental Information. **DELIVERABLE:** Integrate volunteer observations from the Maine and California phytoplankton monitoring networks into NOAA's PMN ERDDAP database;
3. Distribute PMN platform to Alaskan Arctic tribal members to monitor HABs in partnership with Southeast Alaska Tribal Ocean Research and NOAA Education **DELIVERABLE:** Introduce the Southeast Alaskan tribal monitoring network to high school classes through outreach materials and lesson plans to the Sitka Tribe by the third quarter;
4. Develop strategy with the NOAA Office of Education to expand citizen science monitoring into the Arctic communities of Alaska in support of the White House's Arctic Science Ministerial by the fourth quarter. **DELIVERABLE:** Distribute PMN platform to Alaskan Arctic tribal members to monitor HABs.

DELIVERABLES REPORTED BY SUPERVISOR TO NCCOS

PERFORMANCE

DELIVERABLE	PROGRESS	DATE	IMPACT
THIRD QUARTER			
Report AOP Milestone: A tribal monitoring network for coastal HABs will be established using standardized phytoplankton monitoring protocols for the Sitka tribes of Alaska. Nine Sitka tribes will each operate a phytoplankton monitoring site to monitor harmful algae that threaten subsistence harvests with paralytic shellfish poisoning.	Completed: 05/17/2015 Nine of nine sites in operation. Update 11/1/2014 Six of nine sites in operation. Workshop in May to bring on three remaining sites	5/17/2015	The Sitka Tribe now has capability to monitor HABs in shellfish growing areas to take action to restrict harvesting when toxins are likely to contaminate shellfish. They have taken the next steps to test shellfish for PSP toxin and formed SE Alaska Tribal Toxins Partnership with help of NCCOS scientists.
Report AOP Milestone: A citizen monitoring network for freshwater HABs will be established using phytoplankton monitoring protocols in communities in the Great Lakes. Twenty citizen monitoring sites will be operational in the third quarter to provide early warning of cyanobacteria harmful algal blooms spanning the western to eastern basins of Lake Erie.	Completed 7/22/2015 Human Observing Network Sites Operational : 4th Update, 6/23/2015 Roll out program with six sites in Lake Erie with training workshop in Monroe, MI and four sites requested by EPA in region 8 operational on 6/26/2015 . Workshops held in Toledo, OH on 6/25/2015. 4/10/2015 Workshop delayed due to prolonged winter condition EPA/NOAA roll out still on schedule. 2/2/2015, MOA with EPA cleared 12/15/2014.	7/22/2015	The Great Lakes has new capability to monitor cyanoHABs for early warning. This capability also provides in the water validation for NOAA's GL Ecological Forecast. Michigan Sea Grant has joined the effort to expand the human observing network to include Lake St. Clare, one of the potential initiation sites of harmful algal blooms.
Report AOP Milestone: Optimize shellfish toxin sensor to improve FY15 Gulf of Maine Red Tide Forecast	ESP with fully operational PST sensor deployed in Gulf of Maine first week of May with 8 measurements conducted thus far - low levels of PSTs detected intermittently with mission scheduled to end mid-June and results consistent with Alexandrium data reported by HAB sensor on ESP; 2nd Update, 4/10/2015: technical issue resolved, sensor working on instrument, to be canned up next week for deployment in early May. 1st Update, 3/10/2015: an unknown technical issue has arisen with the ESP instruments that is currently prohibiting proper operation of the PST sensor/assay. This is not an issue with the PST sensor/assay, but a mechanical issue with the ESP that must be resolved satisfactorily in order to proceed with deployment of the sensor on an ESP this Spring in the Gulf of Maine.	5/7/2015	Data on Alexandrium toxicity and cell abundance transmitted from the ESP's offshore location will be distributed to coastal resource and fisheries managers and help provide an early warning of impending shellfish toxicity in the area. This ESP and two additional instruments detecting only Alexandrium cells will be deployed alongside instrumented buoys operated by the IOOS-Northeastern Regional Association of Coastal and Ocean Observing Systems (NERACOOS), providing valuable physical and chemical data. Collectively, this information will supplement weekly experimental red tide forecast updates based on predictive models, with the aim of transitioning to an operational NOAA HAB forecasting system for the Gulf of Maine.
FOURTH QUARTER			
Report AOP Milestone: Produce domoic acid sensor for the Northwest Enhanced Moored Observatory (NEMO) as part of IOOS-funded project to integrate toxin detection with the existing network of moored oceanographic sensors in the Juan de Fuca eddy	Completed 8/3/2015: Domoic acid sensor calibrated on Environmental Sample Processor (ESP) platform located at NOAA's Northwest Fisheries Science Center (NWFSC) in Seattle, Washington on. ESP test deployment initiated successfully on 8/6/2015 in Puget Sound, WA. 3rd Update, 6/11/2015: hardware & software modifications completed on ESP to integrate DA sensor; initial test runs successful with sensor calibration to follow; plans for August deployment in Puget Sound being finalized; 2nd Update, 4/10/2015: Trial deployment of sensor in new mooring system set for Puget Sound in August 2015; 1st Update, 2/10/2015: Parts ordered for modification of NWFSC ESP instrument to accommodate DA sensor for deployment on NEMO; installation and bench testing scheduled for 3Q FY15 in collaboration with NWFSC and MBARI.	8/3/2015	Washington state, along with the entire West Coast, has experienced an unprecedented harmful algal bloom (HAB) event this year related to DA-producing Pseudo-nitzschia. Advancing the ability to provide near real-time data on HAB cell and toxin levels via ESP deployments now and in the future will not only help to provide early warning of resource contamination, but in combination with physical and chemical data from regional ocean observing systems (e.g., NANOOS) can support predictive models needed to forecast Pseudo-nitzschia blooms and impacts in the Pacific Northwest.

Water Prediction

Strengthening our Nation's Water Security and Reducing Vulnerability to Climate Change & Variability

Increased Capability in Water Prediction Nationwide

On August 16, 2016, NOAA's efforts to build a "Weather-Ready Nation" took a major step forward with the National Weather Service's launch of a new, highly sophisticated National Water Model (NWM).

This new system is a continental-scale water resources model based on the Weather Research and Forecasting Hydrology (WRF-Hydro) architecture developed by the National Center for Atmospheric Research (NCAR) and represents NOAA's first foray into high performance computing for water prediction.

Unprecedented in its reach, this new National Water Model leverages NOAA's investment in atmospheric prediction and data from over 8,000 U.S. Geological Survey (USGS) stream gauges to produce flow simulations for 2.7 million stream reaches, extending water resources information to the homes and businesses of 100 million Americans who live in coastal communities.

Using this model, NWS forecasters now have access to data for 700 times more locations than previously available. For the first time, communities will receive hourly, weekly, and monthly water forecasts based on output from the National Water Model.

This information will help businesses, community leaders, first responders, emergency managers, and state and local governments make more informed decisions to protect lives and livelihoods.

Tracking Precipitation to Provide Flash Flooding Forecasts at the Neighborhood Level

The Flooded Locations and Simulated Hydrographs (FLASH) project advances the state of flash flood prediction through newly developed rainfall estimation tools and hydrologic models.

FLASH begins with rainfall rates measured by radar and uses a sophisticated modeling system to track what every raindrop is doing on the ground: whether it infiltrates into the soil or flows across impervious roads, parking lots, and waterways. The system models where water will go and when and where it will become a flood, with updates as frequent as every two minutes — a key attribute for cities that can flood quickly.

In FY16, research indicated that the FLASH system doubles accuracy of the current operational system and improves the spatial resolution by 500%, which can indicate specific locations of flash flood impacts downstream, saving lives and mitigating damage to property.

45

These new high-resolution tools will provide reliable flash flood forecasts at the neighborhood level as well as provide up to six hours of forecast lead time, affording critical time for community response. FLASH improves National Weather Service forecasters' abilities to identify rare, severe flash floods from minor ones, enabling them to communicate this information to local emergency managers and the public.

The FLASH forecasts are particularly useful over small, fast-reacting headwater basins and in urban catchments, complementing the new National Water Model for flash flood modeling and prediction.

Better Toxin Detection for Harmful Algal Blooms

Toxins produced by harmful algal blooms (HABs) accumulate in marine resources and are a major cause of human seafood poisoning, which impacts subsistence harvests, economic development, and international trade.

Overabundance of harmful algae can result in phenomenon known as red tide.

46

Tests, known as receptor binding assays, developed by NOAA scientists to measure levels of HAB toxins have recently been accepted by the Interstate Shellfish Sanitation Conference.

This standardized test for regulatory users helps secure the food supply against these potent algal-based toxins and is in various phases of implementation in testing laboratories worldwide.

In Alaska, NOAA scientists trained staff at the Sitka Tribe of Alaska Environmental Regulatory Laboratory on the extraction and detection of HAB-related paralytic shellfish toxins. Implementation of this NCCOS-developed technology by the Sitka tribe will mitigate the threat of toxic shellfish consumption from traditional subsistence shellfish harvesting to members of the Southeast Alaska Tribal Toxins partnership.

The development of HAB toxin detection methods, specifically receptor binding assays, also has a domestic and international component for their implementation.

Domestically, the use of this method is currently being evaluated by relevant public health agencies in Washington and California. Internationally, NOAA has an agreement with the International Atomic Energy Agency to support the use of this method worldwide.

In-situ Water Collection Instrument Sequences Samples in Near Real Time

In September 2016, for the first time, an Environmental Sample Processor (ESP) was deployed in a freshwater system. The ESP—a "lab in a can" designed by Monterey Bay Aquarium Research Institute (MBARI)—autonomously collects water samples, then extracts and analyzes them for harmful algae abundance and their related toxins in near real-time.

In collaboration with NOAA's National Centers for Coastal Ocean Science (NCCOS) and the Cooperative Institute for Limnology and Ecosystems Research (CILER), NOAA's Great Lakes Environmental Research Laboratory is developing the capability to monitor for microcystins, the dominant toxins in western Lake Erie harmful algal bloom (HAB) events, in real-time.

The goal is to combine the ESP toxin data with NOAA's other Lake Erie HAB forecasting products to act as an early warning system for drinking water managers.

Water Prediction

Environmental Sample Processor (ESP) deployment.

In 2014, over 400,000 residents of Ohio were deprived of municipal drinking water after HAB contamination was detected in drinking water drawn from Lake Erie.

This suite of tools will provide critical data on bloom location, toxicity, and predicted movement before the water reaches municipal water intakes.

47

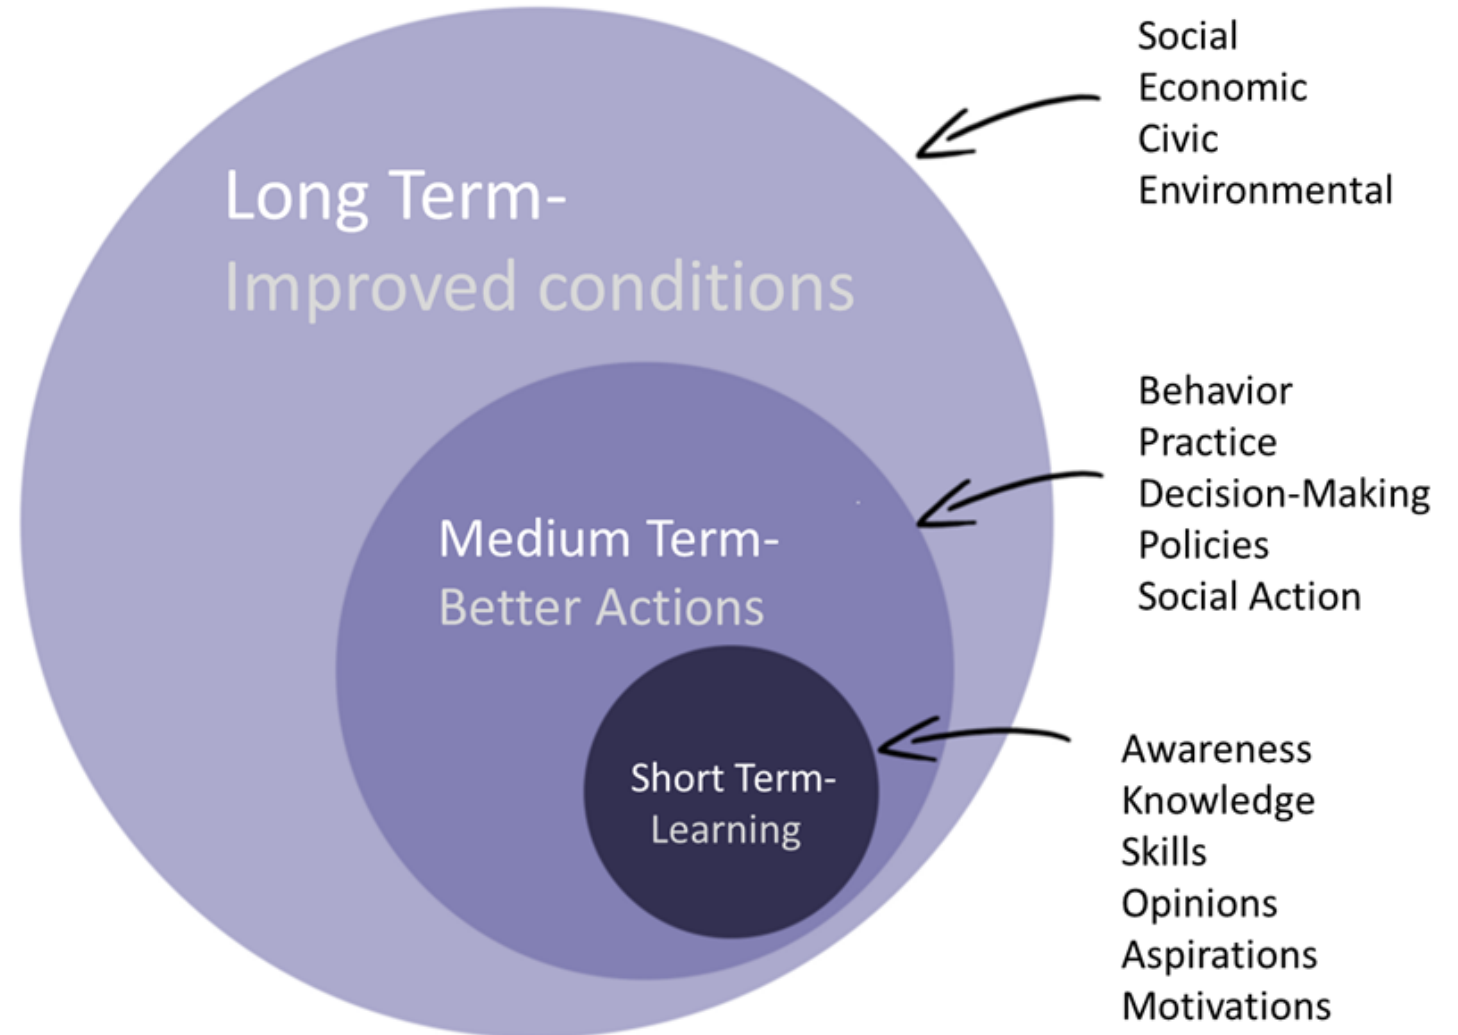

HAB Monitoring and Reference Branch- Outcomes are our Relevance Measure

RELEVANCE

“what would not have happened if NCCOS did not exist, and how much would society have missed?”

OUTPUT: The important products we create (e.g. standard methods, analyses, tools, workshop reports, data, models, services, training).

OUTCOMES: The *differences* made by the outputs that benefit our customers, the resources they manage and the people that utilize and benefit from these resources.

OUTCOME STORIES ARE QUALITATIVE MEASURES OF OUTCOMES

Our outcome Stories document changes in:

Any story captures an outcome at a specific point in time;
Outcomes continue to evolve for years after project completion

HAB Monitoring and Reference Branch- Case Outcome Story

Paralytic shellfish poisoning (PSP) is a world-wide, sometimes fatal seafood poisoning caused by potent algal neurotoxins that accumulate in shellfish. Both U.S. and international shellfish commerce regulations require testing for PSP. The only approved testing method in the U.S. had been the mouse bioassay, until the Interstate Shellfish Sanitation Conference (ISSC) voted to accept a receptor binding assay, developed by NCCOS scientists, as an official method. This approval is the culmination of over a decade of effort to replace live animal testing for PSTs.

**Amount of saxitoxin
That would kill an adult**

Timeline for transition to application for PSP high throughput receptor assay

RELEVANCE

	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
DELIVERABLE	RL 1-2: basic and applied research					RL 3-5: proof-of-concept and system validation					RL 6: Demo in relevant test environment					RL 7: Demo in operational environment					RL 8-9: Finalized system/deployed routinely						
NEED	The original impetus for developing the method was a desire within the U.S. and internationally to develop assays to replace the existing live animal testing protocol, the mouse bioassay, used for regulatory testing of shellfish.					The transfer of the technology to developing countries begin when the Philippines experienced several human fatalities due to paralytic shellfish poisoning, and requested assistance from the U.N. for establishing testing procedures.					Within the U.S., individual states have requested training on the method at NCCOS (Florida, California) and a private company contracted to perform testing for FDA in offshore waters similarly requested training and assistance in setting up the assay in their lab					Regulatory approval is needed for the technology to be used in an operational environment.					Materials required to readily available by operational vendors and routine deployment demonstrated by operations						
IMPEDIMENT	Saxitoxins in shellfish have 23 different metabolites nearly impossible to determine by analytical methods.					Chemical Weapons Convention Ban prohibited transport of saxitoxin. Radiolabeled saxitoxin was not longer available.					In order to be accepted for regulatory use, extensive collaborative testing of methods is required, this requires single and interlaboratory validation studies requiring study design and carefully prepared materials					Regulatory approval and operational laboratories.					Receptor preparation requires homogeneity and worldwide access Routine deployment requires full operation by users						
RESOLUTION	The PSP receptor based assay was developed as an alternative to the mouse bioassay that eliminates the need for live animal testing for marine toxins. The PSP receptor assay detects each toxin in proportion to its potency and provides a summed total toxicity measurement.					STX calibration standard exempt from NRC regulations, FDA develops new radiolabel synthesis and IAEA opens import of radiolabeled saxitoxin. NCCOS conducts extensive evaluation of new products.					IAEA sponsors AOAC studies. NCCOS coordinates studies and prepares materials for multiple studies.					FDA works with NCCOS to establish regulatory approval					Test and validate Porcine preparation, [11- ³ H] STX and NIST Reference Material 8642 calibrating solution		Set up laboratory in Alaska tribal nation; Encourage states to adapt method into regulatory laboratories				
PARTNER	Wallac-Perkin Elmer					IAEA and FDA					CDPH		Testing Laboratories			FDA, ISSC, Resource Access International					Sigma-Aldrich, ARC, FDA, NIST		SEATOR, CDPH				
OUTPUT	The assay was also developed in high throughput format permitting analysis in an 8 x 12 array using a six-probe instrument designed by Wallac Corporation. The PSP receptor assay was published in 1997 with a comparison to the mouse bioassay					The International Atomic Energy Agency supported scientists from seven Southeast Asian nations, Philippines, Malaysia, Indonesia, Vietnam, Thailand, Pakistan, and China, to receive technical training and technology transfer on receptor assays for the family of toxins responsible for paralytic shellfish poisoning (PSP).					Optimization study published by CDPH and NCCOS J AOAC Int. (2003) 86 (4):737-741		Preliminary Interlaboratory Study (5 labs, seven shellfish samples)		AOAC International Collaborative Study (15 labs, 21 shellfish samples, multiple species from around the world SLV published J AOAC Int. (2009) 92:1706-1713			International Collaborative Study approved by AOAC and published J AOAC Int. (2012) 95(3):795-812		FDA guides ISSC approval and CODEX acceptance NCCOS transfers technology to Resource Access International		Saxitoxin kit for receptor binding assay: 50µCi [11- ³ H]STX, 100µg saxitoxin dihydrochloride (RM) 60 vials porcine brain homogenate,		NCCOS guide and train operation of toxin testing laboratory in for SEATOR Publication of Regulatory Use by CDPH Food Addit Contam Chem Anal 2018 35(1):144-158.			
OUTCOME	An alternative to the mouse bioassay that eliminates the need for live animal testing for paralytic shellfish poisoning					NOAA, IAEA, and the FDA are concerted actions to develop and to validate a radioligand based method, the receptor binding assay (RBA).					California is the first state to evaluate PST receptor assay for future regulatory use			23 Member States in Africa, Asia, the Pacific region and Latin America are trained to use PST receptor method			AOAC Official Method of Analysis		U.S. Regulatory Approval Commercial Operation supports shellfish harvest in Gulf of Maine		All materials are commercially available worldwide		STAERL laboratory operation California independently published commercial materials provide accurate determination of PSTs in shellfish

Text of Proposal/ Requested Action	This submission presents the 'Matrix Expansion for the Receptor Binding Assay (RBA) for Paralytic Shellfish Poisoning (PSP) Toxicity Determination to Allow Use with Geoduck' for consideration as an NSSP Approved Method for Marine Biotoxin Testing for PSP in Geoduck. The RBA is a competition-based assay that	

Product Details

Saxitoxin kit for RBA testing

Tested for applicability under regulatory use
 California Department of Public Health
 Food Additives & Contaminants: Part A 2018

Specifications

Specific Activity: Saxitoxin kit for RBA testing includes 50uCi of STX [11-3H], 100ug STX dihydrochloride, 60 porcine b

Synonym: Methanol (for 3H) | Ethanol (for unlabeled)

Solvent: Methanol (for 3H) | Ethanol (for unlabeled)

Concentration: 0.05 mCi/ml | 0.1 mg/ml

CAS Number: Not available

Shipped in dry ice: Yes

Exclusive: ARC Exclusive

Reference: Former ART 1301, ARCD 0741, ARCD 1301 components included

NCCOS SDI HAB Forecasting Branch

In 2012, what were we doing?

Gulf of Mexico

We developed the bulletin content starting in 1999

- New product and concept (Stumpf et al., 2001, 2003)

- Chlorophyll “bloom” anomaly (ecological indicator)

- Enhanced with Ensemble approach (Tomlinson et al., 2004; 2009)

- Resuspension correction for Texas (Wynne et al., 2008)

- Upwelling forecast (Stumpf et al., 2003) model (Lanerolle et al. 2005; Stumpf et al., 2008)

Harmful Algal Bloom Forecast System, shift from SeaWiFS original to MODIS in 2010

Page 1

Gulf of Mexico Harmful Algal Bloom Bulletin
21 September 2004
National Ocean Service/NCCOS and CSC
NESDIS/CoastWatch and NDBC
Last bulletin: September 17, 2004

Analysis
HAB Forecast:

No harmful algal blooms have been found along Florida's coast. Recent tropical storms have caused sediment resuspension and non-harmful blooms, which may cause discolored water.

Analysis:

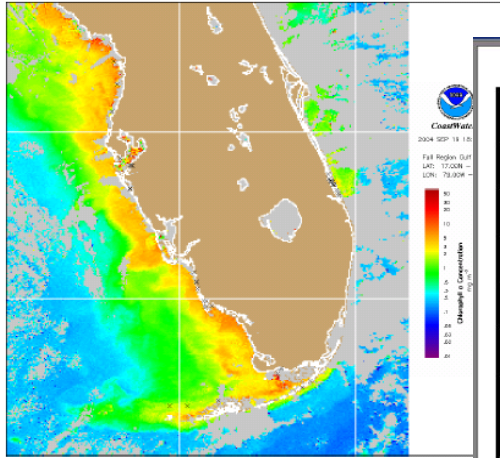

Samples taken last week from southwest Florida near Sarasota, Fort Meyers, and Naples showed no *Karenia brevis*. Imagery shows elevated chlorophyll along much of Florida's west coast: concentrations over 4 micrograms per liter off Cape San Blas and Cedar Key; over 5 micrograms per liter near Clearwater, Sarasota, Naples; and over 7 micrograms per liter Everglades City.

Winds have favored upwelling in southwest Florida for several days and are forecasted to continue for the rest of the week and through the weekend. These conditions are conducive to HAB formation, so this area should be monitored. Sampling here is recommended. Conditions in the panhandle don't favor HAB formation.

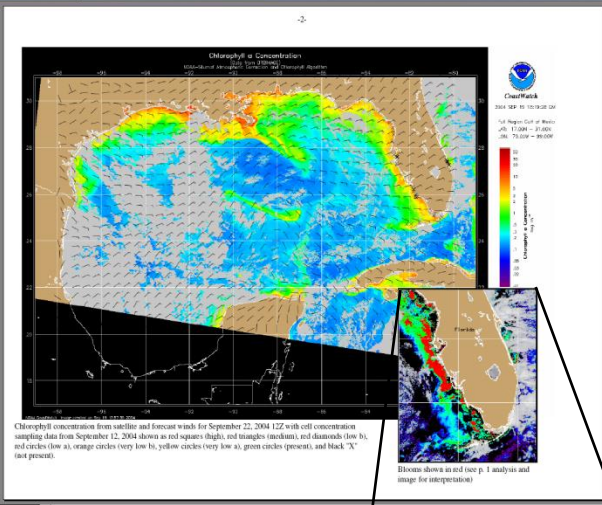

Bronder, Stolz

Please note the following restrictions on all SeaWiFS imagery derived from CoastWatch.

1. These data are restricted to civil marine applications only; i.e. federal, state, and local government use/distribution is permitted.
2. Distribution for military, or commercial purposes is NOT permitted.
3. There are restrictions on Internet/Web/public posting of these data.
4. Image products may be published in newspapers. Any other publishing arrangements must receive OrbImage approval via the CoastWatch Program.

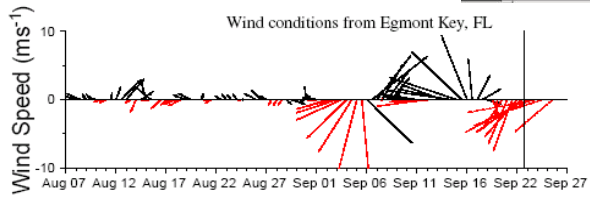

Chlorophyll concentration from satellite with possible HAB areas shown as red squares (high), red diamonds (low b), red circles (low a), orange circles (very low b), yellow circles (present), and black "X" (not present).

Chlorophyll concentration from satellite and forecast winds for September 22, 2004 12Z with cell concentration sampling data from September 12, 2004 shown as red squares (high), red diamonds (low b), red circles (low a), orange circles (very low b), yellow circles (present), and black "X" (not present).

Blooms shown in red (see p. 1 analysis and image for interpretation)

Wind conditions from Egmont Key, FL

Wind speed and direction are averaged over 12 hours from measurements made on buoys. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts.

Southwest Florida: Winds have been northeasterly for the past few days, and are forecasted to shift to easterly then northeasterly over the next couple of days. The NWS Marine Forecast calls for easterly winds until Thursday, then northeasterly winds over the weekend. Florida Panhandle: Winds have been northeasterly for the past few days, and are forecasted to become easterly for the next couple of days.

Gulf of Mexico Harmful Algal Bloom Bulletin
Region: Texas
5 October 2009
NOAA Ocean Service
NOAA Satellites and Information Service
NOAA National Weather Service
Last bulletin: September 29, 2009

Conditions Report
There are confirmed reports of harmful algae identified at South Padre Island and Brazos Santiago Pass. Low impacts have been observed in this region and are likely throughout the week.

Analysis
Imagery (although mostly cloudy) does indicate an elevated chlorophyll feature along the southern Texas coasts. Reports of beach goers in the vicinity of South Padre Island experiencing respiratory irritation have been received. Researchers have positively identified *Karenia brevis* in water samples from this area. Cell counts are at low B to low A range. Strong south to southeast winds may push the bloom south as the week progresses.

--Jewett, Wynne

Satellite chlorophyll image with possible HAB areas shown by red polygon(s). Cell concentration sampling data from September 26 to October 2 shown as red (high), orange (medium), yellow (low b), brown (low a), blue/very low b, purple (very low a), pink (present), and green (not present). For a list of cell count data providers and a key to the cell concentration categories, please see the HABIS bulletin guide: http://idesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Please note the following restrictions on all SeaWiFS imagery derived from CoastWatch:
1. Data are restricted to civil marine applications only; i.e. federal, state, and local government use/distribution is permitted.
2. Image products may be published in newspapers. Any other publishing arrangements must receive Geotitles approval via the CoastWatch Program.

Wind Analysis
South to southeast winds 15 to 20 knots through Friday.

Wind speed and direction are averaged over 12 hours from buoy measurements. Length of line indicates speed, angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts. Wind observation and forecast data provided by NOAA's National Weather Service (NWS).

Supporting routine cleaning of Flow Cytobot, at Aransas Pass, a research instrument that provided initial identification of the last three blooms.
Goal: demonstrate enhancement of forecasts.

Gulf of Mexico

We developed the bulletin content starting in 1999

CoastWatch implementation for G.Mexico (1999, 2002)

national anomaly with NOAA-20 (Coastwatch/OceanWatch)

New product and concept (Stumpf et al., 2001, 2003)

Chlorophyll “bloom” anomaly (ecological indicator)

2015, Enhanced with Ensemble approach (Tomlinson et al., 2004; 2009)

Resuspension correction for Texas (Wynne et al., 2008)

Upwelling forecast (Stumpf et al., 2003) model (Lanerolle et al. 2005; Stumpf et al., 2008)

What's next for Florida and Texas

- The problem. Respiratory forecast for *Karenia* red tide.
- NASA Public Health and Air Quality Program funded project.
- Why now? Technology and models
 - Smartphones
 - Resolution: NWS drastically increased model and forecast resolution (WRF, NDFD, etc.)
 - We were busy for a bunch of years (more later)

Satellite, HABscope and modeling for respiratory irritation in *Karenia brevis* (red tide) outbreaks

Applied Sciences Program
NASA Earth Science

Florida Red Tide

Toxic *Karenia brevis* blooms

- Around Gulf of Mexico from Mexico to Florida.
- Late summer/early fall to year long
- Brevetoxins, sodium channel activators
- Toxin kills fish, birds, dolphins and manatees
- Neurotoxic shellfish poisoning
 - Commercial is closely monitored, recreational must follow warnings
- Economic losses in Florida and Texas
- **Respiratory illness in humans**

Toxic Aerosols

- Toxins can aerosolize - particles 3-20 μm range
- Healthy people: upper airway irritant. Coughing water eyes, sinus pain
- People with chronic respiratory illness (like asthma)
 - Toxins are a trigger
- Swimming risk not well known
 - Anecdotal, skin rashes, swelling of lips and eyes

Effects of Exposure

Asthmatics 9% of population

One hour walk on the beach during a red tide; 5 days for pulmonary function reach baseline

54% increase in ER respiratory (asthma, pneumonia, bronchitis)

Sarasota County alone, ER costs increase up to \$4 million, depending on bloom severity

Lifeguards (occupational healthy group) - no pulmonary function measurable effect

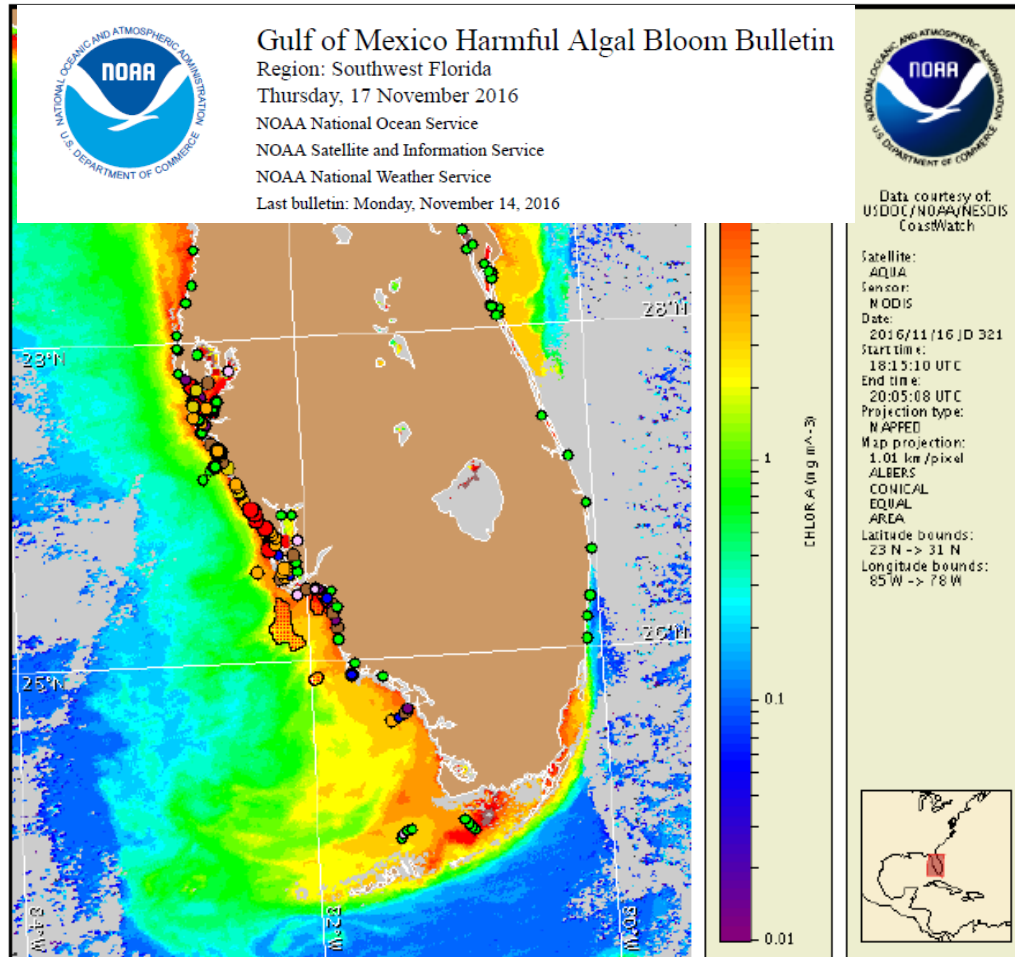

Loss revenue to area businesses (\$6 million/month per county)

Critical need to accurately warn the public

Everyone reacts, useful indicator exposure

NOAA HAB forecast system bulletin

Satellite chlorophyll image with possible *K. brevis* HAB areas shown by red polygon(s), when applicable
Points represent cell concentration sampling data from November 7 to 15: red (high), orange (medium),

Conditions Report

Not present to high concentrations of *Karenia brevis* (commonly known as Florida red tide) are present along- and offshore portions of southwest Florida, and not present in the Florida Keys. *K. brevis* concentrations are patchy in nature and levels of respiratory irritation will vary locally based upon nearby bloom concentrations, ocean currents, and wind speed and direction. The highest level of potential respiratory irritation forecast for Thursday, November 17 through Monday, November 21 is listed below:

County Region: Forecast (Duration)

Southern Pinellas: Low (Th-M)

Southern Pinellas, bay regions: Moderate (Th-M)

Northern Manatee, bay regions: High (Th-M)

Southern Manatee: Very Low (Th-M)

Southern Manatee, bay regions: Moderate (Th-F, M), High (Sa-Su)

Northern Sarasota: Moderate (Th-M)

Northern Sarasota, bay regions: High (Th-M)

Southern Sarasota: Low (Th-M)

Southern Sarasota, bay regions: High (Th-M)

Northern Charlotte: Low (Th-M)

Northern Charlotte, bay regions: High (Th-M)

Southern Charlotte: Low (Th-M)

Southern Charlotte, bay regions: High (Th-M)

Northern Lee: Low (Th-M)

Northern Lee, bay regions: Moderate (Th-M)

Central Lee: Low (Th-M)

Central Lee, bay regions: Moderate (Th-M)

Southern Lee: Very Low (M-Th)

Southern Lee, bay regions: Low (Th-M)

Northern Collier: Low (Th-M)

Central Collier: Very Low (Th-M)

All Other SWFL County Regions: None expected (Th-M)

NOAA started demo in 1999. In 2004, bulletin made operational in Florida.
tidesandcurrents.noaa.gov/hab/beach_conditions.html

Current respiratory warning

NOAA Harmful Algal Bloom Operational Forecast System (HAB-OFS) Operational Conditions Reports

- Warnings are by the county and vague over the day.

Bloom
from
satellite

Figure 1. MERIS image from the European Space Agency. Imagery shows the spectral shape at 681 nm from September 03, where colored pixels indicate the likelihood of the last known position of the *Microcystis* spp. bloom (with red being the highest concentration). *Microcystis* spp. abundance data from shown as white squares (very high), circles (high), diamonds (medium), triangles (low), + (very low) and X (not present).

forecast

Figure 2. Nowcast position of *Microcystis* spp. bloom for September 08 using GLIFS modeled currents to move the bloom from the September 03 image.

Conditions: A massive *Microcystis* bloom persists throughout most of Lake Erie's Western Basin.

Analysis: As indicated in satellite imagery from Saturday (9/3/2011), an enormous *Microcystis* bloom was present in western Lake Erie. The southern extent of the bloom was remotely observed along the coast of Ohio from Maumee Bay to Catawba Island. The northern extent of the bloom was observed to be consistent along the Michigan coast from Northern Maumee Bay to the mouth of the Detroit River. The eastern-most portion of the bloom was observed past Point Pelee and to the northeast up in to Rondeau Provincial Park.

At the mouth of the Detroit River, a five day nowcast shows a southward suppression of the western-most portions of the bloom. However, the bloom is likely to still persist in much of the Western Basin. The nowcast also suggest the bloom has spread to the east of Sandusky and into the Cleveland area. (Note: Due to a lack of clear imagery the bloom has not been remotely observed in the Cleveland area.) A three day forecast also suggests that the bloom will persist to the north of Cleveland through the weekend. Water temperatures remain above 20 degrees Celsius and are forecast to decrease into the weekend; however, conditions remain favorable for bloom growth.

2012 was mild bloom. Spring load matters

2013 Task Force

Department of Agriculture
Department of Natural Resources
Environmental Protection Agency
Lake Erie Commission

Targets for spring specifically,
37% of TP, 41% of DRP spring
as well as annual

For the Maumee River, the Task Force recommends targets for spring loads (defined as 1 March to 30 June) and annual loads (water years, 1 October to 30 September) for both total phosphorus and dissolved reactive phosphorus based on 11 years (2002-12) of observation and models that have proved to be highly accurate. Spring phosphorus loading in particular has been shown to be highly predictive of subsequent HAB size.

**San Luis Reservoir Algal Bloom Now at 'Danger' Level
Public Urged To Avoid Water Contact, Not Eat Fish**

Utah Lake supporting EPA region 8 and Utah DEP

June 29, 2017

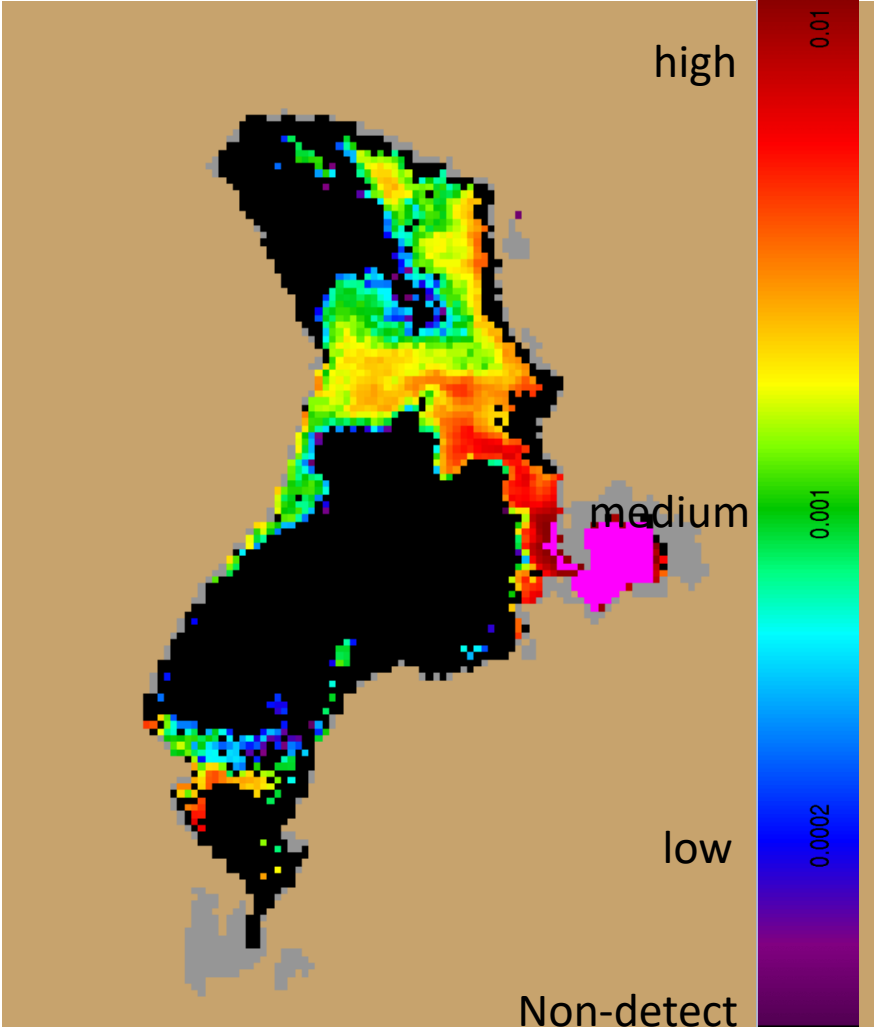

(one of the largest freshwater lakes in western U.S.)

Algal bloom in Utah Lake's Provo Bay begins spreading north

POSTED 4:45 PM, JUNE 30, 2017, BY MARK GREEN. UPDATED AT 04:48PM, JUNE 30, 2017

Satellite images show the bloom heading north, following a similar pattern to that seen with last year's bloom that shut down Utah Lake. The press

PMN Development Timeline

OVERVIEW

Quality Measures

A measure of soundness, accuracy and reproducibility of a specific body of research

Rigour - A certain level of experience and training that provides an appropriate level of circumspection.

Reproducibility - The use of multiple approaches to address a question.

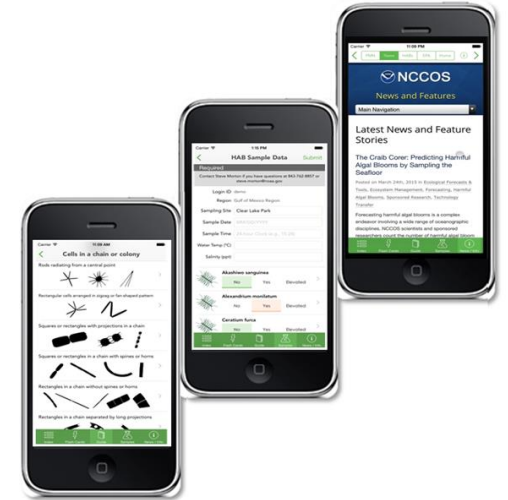

Routine - The management of quality.

Robustness - That which is credibly inferred from the application of our findings.

QUALITY

Use of Technology

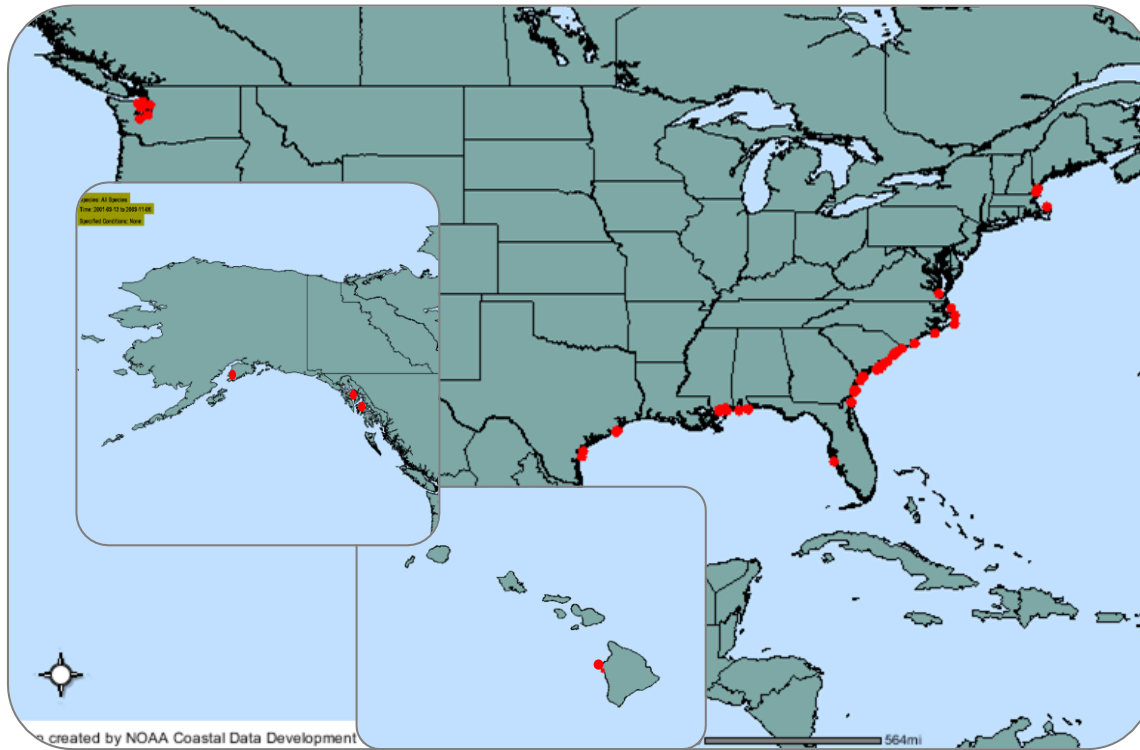

Rigour: combination of staff experience & use of tools delivers quality results:
Interfacing users with technology

QUALITY

Phytoplankton Monitoring Network

Bloom Events from 2001 – 2017

Volunteer Reported Blooms > 200

Non-harmful species > 150

Potentially toxic species = 37

Confirmed toxic events = 12

- ▶ 9 Domoic Acid
 - ▶ Texas = 3
 - ▶ Mississippi = 2
 - ▶ North Carolina = 2
 - ▶ Alaska = 2

NOAA PMN SAMPLE ANALYSIS REPORT

SAMPLE ANALYZED BY: Andrew Shuler

SAMPLING SITES: Port Jefferson Village Pier

SAMPLE DATE: 10/24/2012

SUMMARY:

Sample contained a significant abundance of both *Chaetoceros* and *Pseudo-nitzschia*. There were six or more different species of *Chaetoceros* and two species of *Pseudo-nitzschia*.

COMMENTS:

Counts were done from the 1L live sample shipped overnight, due to the 30mL bottle containing a net tow sample instead of the whole water grab sample.

Bloom conditions are those in which the concentration exceeds 1,000,000 cells/L. This sample exceeded this value with *Chaetoceros* concentrations estimated at 15,000,000 cells/L. But more interesting was the concentration of *Pseudo-nitzschia*, even though it was closer to the threshold of 1,000,000 cells/L, the species of *Pseudo-nitzschia* present typically produces a significant amount of toxin per cell.

The two species of *Pseudo-nitzschia* present were *P. pungens* and *P. multiseriis*. Of the two, *P. multiseriis* is of the most concern. If you compare image 1308-1.0 to 1308-3.0 you will see these cells look similar, yet you will notice in 1308-3.0 there are 3 rows of small pores in each striae. This arrangement is unique to *P. multiseriis* and clearly differentiates it from *P. pungens*.

Domoic acid (DA) is the toxin of concern with *Pseudo-nitzschia*. DA is not directly ichthyotoxic so a fish kill would not be related to this toxin. Should you notice any fish piping or laboring at the surface this is likely do to the *Chaetoceros* or a dissolved oxygen issue has developed as these blooms subside.

TOXIN RESULTS:

A filtered whole water sample was submitted to the Analytical Response Team (ART) to access DA levels.

The sample submitted to ART tested positive for domoic acid (DA) via liquid chromatography-mass spectrometry (LC/MS), with a concentration of 0.002ng DA per mL of original seawater sample.

This is considered to be an extremely low, background level concentration. The DA regulatory limit in shellfish is 20ug DA per gram of shellfish. With DA concentrations as low as those detected in this water sample, it is highly unlikely that shellfish would test positive for DA, much less exceed the regulatory limit.

If you are interested in more information about *Pseudo-nitzschia*, the toxin domoic acid (DA) or the Human Health Syndrome Amnesic Shellfish Poisoning (ASP), please refer to the PMN Fact Sheet: http://www.chbr.noaa.gov/pmn/docs/Factsheets/Factsheet_Pseudonitzschia.pdf

If you would like a detailed algal toxins report, please contact NOAA PMN.

Table 1: Values equal the average concentration of the listed harmful species in cells/L with values adjusted to compensate for the dilution of preservative (n=3)

Port Jefferson Village Pier	Concentration: Cells/L
<i>Pseudo-nitzschia pungens/multiseriis</i>	2,500,000
<i>Chaetoceros spp.</i>	15,000,000

MICROGRAPHS:

Images were taken on a JEOL 5600 Scanning Electron Microscope and the stubs have been archived at NOAA PMN. The stub number associated with this sample is 1308.

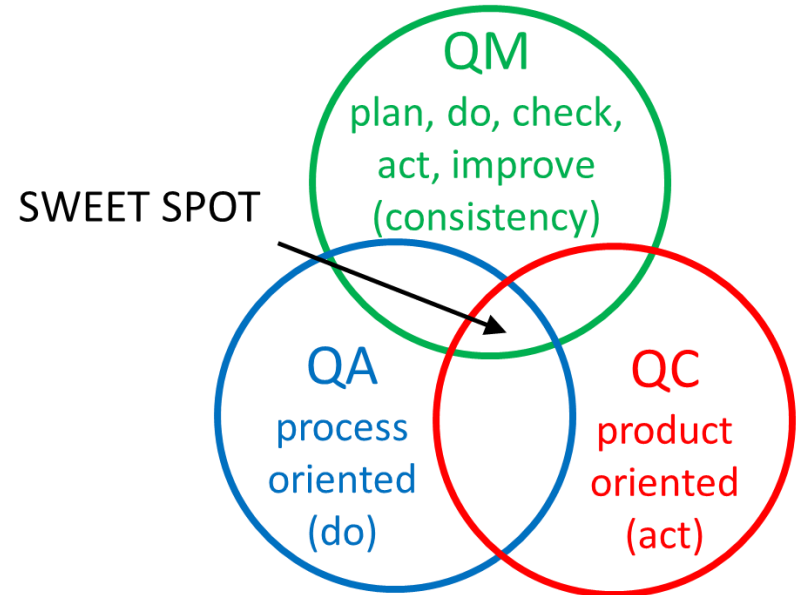

SEM Image 1308-1.0

SEM Image 1308-1.1

SDI WEEKLY - Activities and Accomplishments NCCOS | Stressor Detection and Impacts Division Week of November 6-10, 2017

The SDI Weekly is a list of SDI's current and upcoming activities, accomplishments and relevant news, to be sent out every Friday, to inform NCCOS. It includes related activities from staff in the NCCOS Competitive Research Program (CRP, formerly CSCOR), if you have questions, please ask the contacts in the item of interest, Tracy Gill, or the SDI and CRP branch chiefs; thanks.

 (2) [Coastal Hypoxia Research Program](#) (Due: Jan 30, 2018)
 (3) [Identification and application of acidification thresholds in coastal ecosystems](#) (Letters of Intent Due: Dec 8, 2017)
 Contacts: Kimberly.Pueljize@noaa.gov (FFO #1 and 2), Beth.Turner@noaa.gov (FFO #3) (CRP)

Nov. 6-8 | **New Dr. Cheryl Woodley** of NCCOS Charleston is an invited participant of a Coral Disease Workshop organized by resource agencies of the State of Florida and hosted by Nova Southeastern University Oceanographic Center in **Dania Beach, FL**. The workshop is in response to an ongoing coral disease outbreak along the Florida Reef Tract since 2014, that has affected 23 species with a tissue-loss disease of unknown etiology. The meeting objectives are to discuss intervention and treatment methodologies and associated constraints, create a FL Reef Tract-wide sampling plan, and develop plans for interdisciplinary analysis of existing and future samples. These discussions will engage veterinarians, permitting agencies and animal health experts regarding data needs and strategies to engage in field-based interventions within existing regulatory frameworks. Contact: Cheryl.Woodley@noaa.gov (SDI/Key Species & Bioinformatic)

Nov 3-4 | **New Jen Maucher-Fuquay** of the NOAA's Phytoplankton Monitoring Program held a comprehensive volunteer training workshop at North Carolina State University's Center for Marine Sciences and Technology in Morehead City. Participants included Carteret County educators, NC Aquarium and North Carolina State University Center for Marine Sciences and Technology (CMAST) staff. The first session covered marine phytoplankton protocols and IDs, with a plankton tow demonstration and identification of phytoplankton. The second session focused on the relatively new freshwater monitoring program and its protocols, with additional microscopic identification of fixed and fresh samples. Contact: Steve.morton@noaa.gov (SDI/HAB Monitoring and Reference).

Nov. 1-2 | **New NCCOS Charleston staff Sherri Fields, Marie DeLorenzo, James Daugomah, and Steve Morton** attended the NOAA Diversity and Inclusion Summit. The goal of the Summit was to foster a culture of inclusion within NOAA that will lead to a more diverse and successful workforce. There were speakers from NOAA, as well as guest speakers, with respect for others being a key theme. The presenters shared their personal perspectives and experiences, as well as tools and resources to use for promoting diversity and inclusion. Contact: Marie.DeLorenzo@noaa.gov (SDI/Ecotoxicology).

Oct. 26 - Nov. 2 | **New** Several discussions have been held regarding a possible Great Lakes pilot study to determine if dreissenid mussels can be used effectively to monitoring microplastic pollution. Mark Banaszak Holl, professor at University of Michigan gave an invited presentation to NCCOS, OAR, and ORR scientists on work being done in his lab to measure microplastic dreissenid mussels under controlled laboratory conditions. Follow-on discussions with staff from NOAA's Marine Debris Program, NOAA/OAR/Great Lakes Environmental Research Laboratory and NCCOS Great Lakes Mussel Watch has resulted in an agreement to collaborate. The Great Lakes Mussel Watch team will share archived mussel samples with the Banaszak Holl laboratory who will determine if microplastics can be detected in these mussel samples exposed to WWTP outfall. A follow on Great Lakes field pilot study is planned for summer of 2018 with financial support provided by ORR/MDP. Contact: Ed.Johnson@noaa.gov (SDI/Monitoring and Assessment).

Oct - Nov. | The NCCOS Mussel Watch Program (MWP) has been conducting a series of regional studies on contaminants of emerging concern (CECs), in order to assess the feasibility of including some of these contaminants in the long-term monitoring program. Previous efforts included pilot studies in the Southern California Bight, the Great Lakes, Chesapeake Bay and Charleston Harbor. This year, a similar effort is being conducted in the Gulf of Mexico, where the collection of

DELIVERABLES REPORTABLE TO SUPERVISOR

Enhanced data serving capacity and visualization of the PMN dataset

Developed as part of the Presidential mandated Big Earth Data Initiative

- Discover: improve metadata in archives to make datasets more discoverable by popular search engines (e.g., Google or Bing)
- Access: Develop better web accessible APIs by improving geospatial coordinate handling and response formats
- Use: Improve compatibility with commercial GIS software (e.g., Esri)

Environmental Research Division Data Access Program (ERDDAP) database developed by NOAA-NCEI

- Easier Access to Scientific Data
- Output data into many formats

RELEVANCE

Examples of Data Usage

Downloaded all estuarine salinity data for tide gauge models

Uses HAB distribution in Southeast for use in *Vibrio* model

Downloaded all phytoplankton data to determine ecological changes due to drought

Warns end users to HAB conditions

PMN data to be included in the FY18 annual State of the Ecosystem report

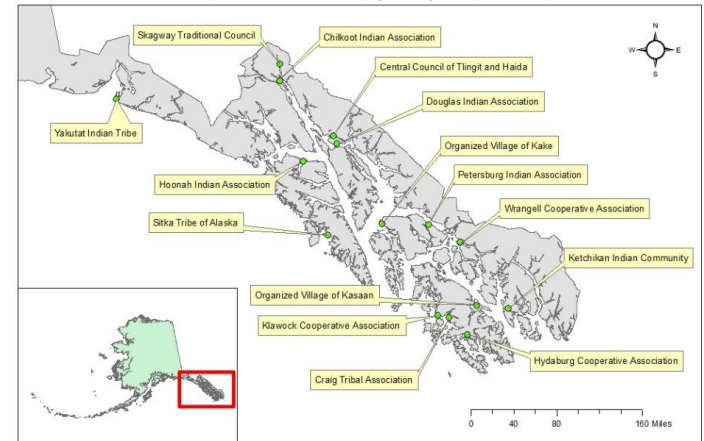

RELEVANCE

Outcome Story: Alaskan Tribal monitoring of toxic phytoplankton

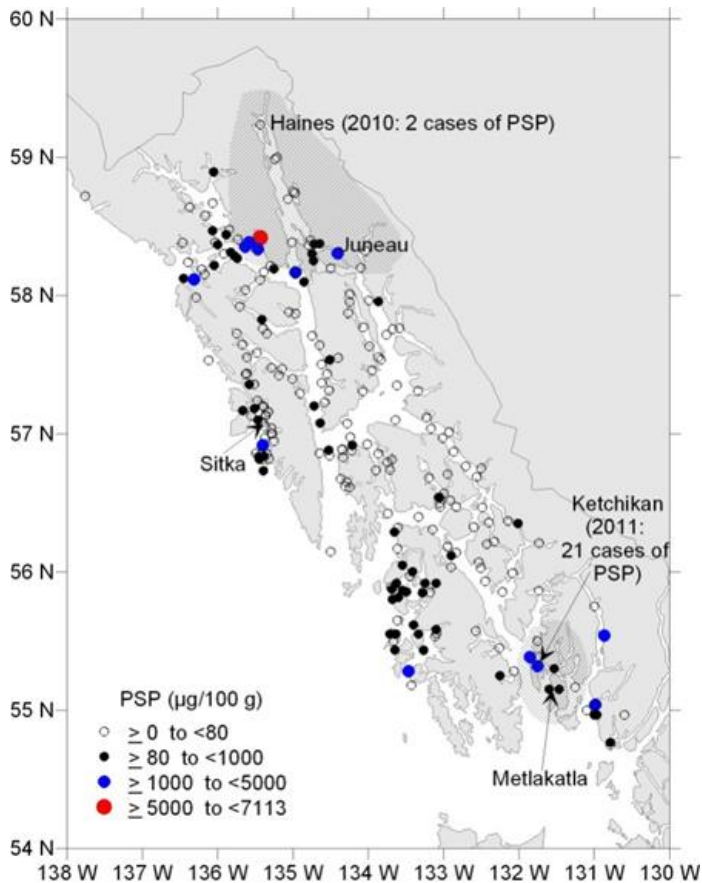

Utilization of PMN sampling and identification techniques was the first step in the creation of the Southeast Alaska Tribal Ocean Research (SEATOR) program

Southeast Alaska Tribal Toxins (SEATT) Partner Locations

Outcome: Enable tribal communities to harvest traditional shellfish sources safely and mitigate the threat of harmful algal blooms through phytoplankton sampling coupled with toxin detection

Maximum PSP toxins (1991-2011)
PSP cases (2010-2011)

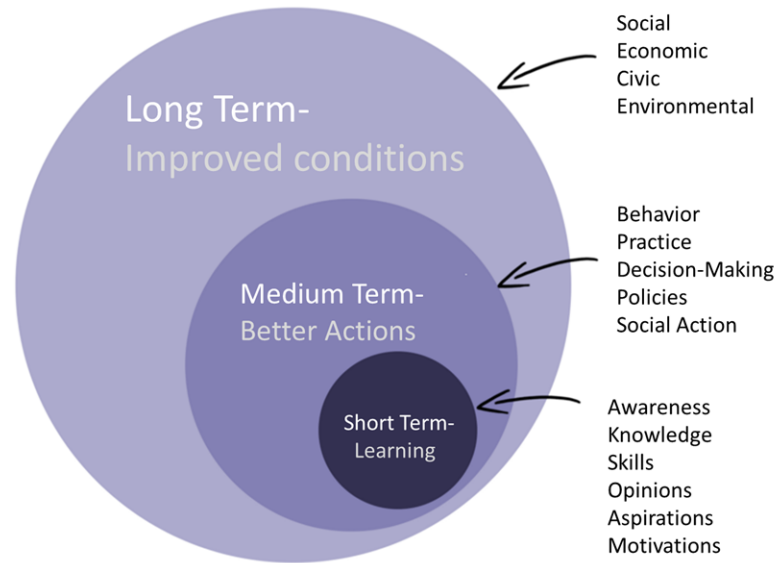

During summer 2017, similar PSP toxin concentrations were observed as 2010-2011. Due to the alerts posted to the tribal communities participating in the SEATOR program in 2017, no deaths or illness were reported.

Research Oceanographer

HAB Monitoring & Reference Branch

Intramural HAB Detection R&D Program - Aligned with National Priorities

Concept for autonomous, in-situ detection of
HAB species and toxins has its roots in the
meeting that produced the document, "Marine
Biotoxins & Harmful Algae: A National Plan"
(Charleston, SC; 1992)

HABHRCA Re-Auth. 2014 (Amend. Act 2017);

Section 603A. (f) (3): develop and enhance,
including with respect to infrastructure, which shall
include unmanned systems, as necessary, critical
observations, monitoring,...and operational forecasts
relevant to harmful algal blooms and hypoxia events

OVERVIEW

Public Law 113-124
113th Congress

An Act

To amend the Harmful Algal Blooms and Hypoxia Research and Control Act of 1998, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

SECTION 1. SHORT TITLE.

This Act may be cited as the "Harmful Algal Bloom and Hypoxia Research and Control Amendments Act of 2014".

SEC. 2. REFERENCES TO THE HARMFUL ALGAL BLOOM AND HYPOXIA RESEARCH AND CONTROL ACT OF 1998.

Except as otherwise expressly provided, whenever in this Act an amendment or repeal is expressed in terms of an amendment to, or repeal of, a section or other provision, the reference shall be considered to be made to a section or other provision of the Harmful Algal Bloom and Hypoxia Research and Control Act of 1998 (16 U.S.C. 1451 note).

SEC. 3. INTER-AGENCY TASK FORCE ON HARMFUL ALGAL BLOOMS AND HYPOXIA.

Section 603(a) is amended—
(1) by striking "the following representatives from" and inserting "a representative from";
(2) in paragraph (11), by striking "and";
(3) by redesignating paragraph (12) as paragraph (13);
(4) by inserting after paragraph (11) the following:
"(12) the Centers for Disease Control and Prevention; and";
and
(5) in paragraph (13), as redesignated, by striking "such".

SEC. 4. NATIONAL HARMFUL ALGAL BLOOM AND HYPOXIA PROGRAM.

The Act is amended by inserting after section 603 the following:
"SEC. 603A. NATIONAL HARMFUL ALGAL BLOOM AND HYPOXIA PROGRAM.

"(a) ESTABLISHMENT.—Not later than 1 year after the date of enactment of the Harmful Algal Bloom and Hypoxia Research and Control Amendments Act of 2014, the Under Secretary, acting through the Task Force, shall maintain and enhance a national harmful algal bloom and hypoxia program, including—

"(1) a statement of objectives, including understanding, detecting, predicting, controlling, mitigating, and responding to marine and freshwater harmful algal bloom and hypoxia events; and

The Vision: in late 1990s, NOAA partnered with MBARI to develop technology enabling the autonomous, in-situ detection of HAB species & toxins

The Environmental Sample Processor (ESP), centerpiece of NCCOS' HAB sensor development effort, aimed to address several long-standing challenges fundamental to effective HAB management & research

❖ "being there"

- autonomous, in-situ sample acquisition, processing, analysis

❖ "always on"

- extended, unattended offshore operations

Next Generation
ESP

OVERVIEW

Every HAB toxin measurement made by an ESP instrument deployed in our Nation's coastal waters or Great Lakes, and reported in near-real time to a resource manager or other stakeholder, is made possible by detection technologies developed by our NCCOS intramural research program

Over two decades, NCCOS' intramural research program to develop autonomous HAB species/toxin detection technology has demonstrated a commitment to quality, performance, & relevance

QUALITY

A measure of soundness, accuracy and reproducibility of a specific body of research

PERFORMANCE

An ability to manage to produce identifiable results, both effectively and efficiently

RELEVANCE

In essence this criterion asks for “what would not have happened if NCCOS did not exist, and how much would society have missed?”

Let's dig a little deeper...

OVERVIEW

Science & Engineering - Technologies that Yield Consistently High-Quality, Actionable Data

- ❖ Work with MBARI engineers on design of hardware for ESP toxin sensor; assist McLane Research Labs to validate 'short puck' format for toxin sensor – *45% more samples per deployment (64 vs. 44)*
- ❖ Design & improve sensors for DA, PSTs, MCY; internal controls & replication; sensors "tuned" to optimize range/sensitivity - *reflects needs of resource & public health managers*
- ❖ Calibrate all toxin sensors using CRMs prior to ESP deployments - ensures quality of quantitative near-real time data provided to managers to *support decision making*

ELISA Small Array Format Puck

BioDot Protein Arrayer

'short puck' format

Pre-deployment Calibration

ELISA Toxin Array

QUALITY

Quality Management, Assurance, and Control

Ensure Successful Mission Outcomes

- ❖ Concept of Operations (CONOPS)
- ❖ iterative improvements to harden & increase reliability of extended ESP operations

ESP Concept of Operations

Deployment name: *ESPfriday Washington Coast, May 2017, habda*

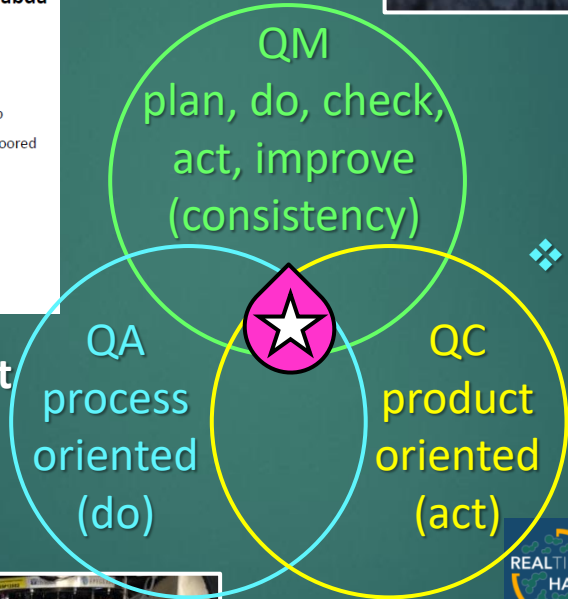

Objectives:

1. Third operational deployment of ESP on WA coast for IOOS OTT project
2. Monitor Pn and DA in Washington coastal waters
3. Deliver near real-time data to end-users via NANOOS NANOOS "Real-time HABs" web app

Deployment platform (mooring, drifter, pier, on shore, benthic, etc): Northwest Enhanced Moored Observatory (NEMO) sub-surface APL-designed mooring

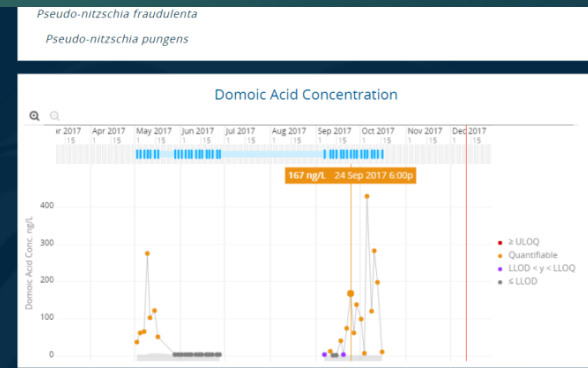

Deployment locations:

Location: Washington coast
Lat/Long: 47.9740°N, 124.9550°W (see Figure 2)
Target ESP Depth (m): 18 m (water pumped from ~2 m to ESP intake)
Bottom Depth (m): 100 m

- ❖ all sensor data analyzed & quality ensured prior to product being released to managers in *near-real time* via web-based tools

- ❖ extensive sensor array/reagent quality & performance checks
- ❖ pre-deployment sensor calibration (CRM) & full-phase testing

QUALITY

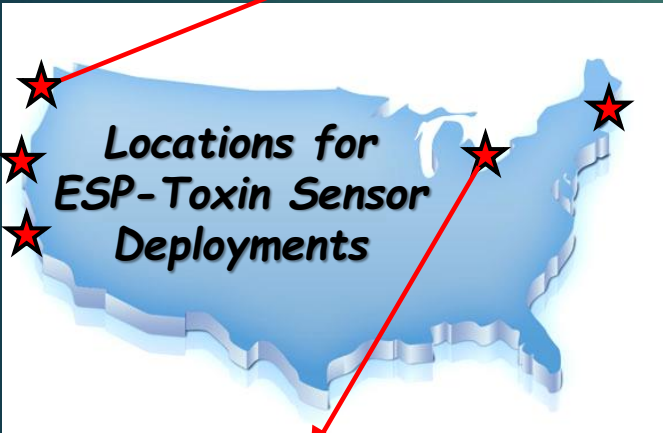

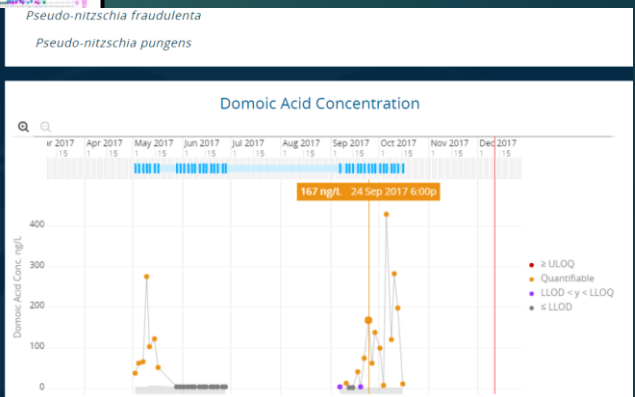

Reliable Detection Technology that Performs in Multiple U.S. Coastal Regions & the Great Lakes

4 deployments - WA coast

- Data displayed in near-real time on NANOOS NVS
- Supports PNW Experimental HAB Bulletin

Near-real time HAB species & toxin disseminated to resource managers via NANOOS NVS & included in Experimental PNW HAB Bulletin

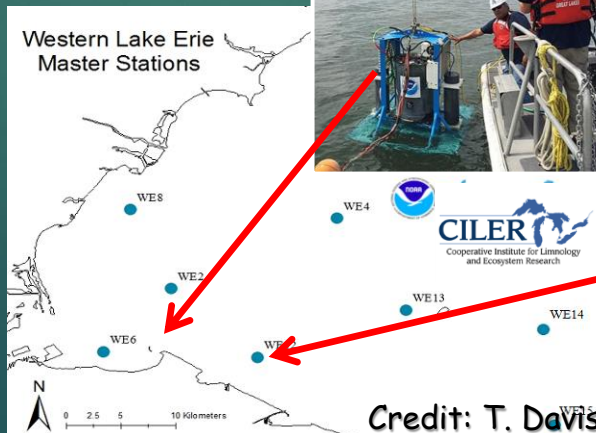

3 deployments - upstream of Toledo water intake

- Toxicity early warning to water managers
- Supports development of L Erie HAB toxicity forecast

First reporting to managers of toxin levels at surface and drinking water intake depths in near-real time

PERFORMANCE

Reliable Detection Technology Yields Deliverables that Track to NCCOS AOP Milestones and the HAB Sub-Priority Area Implementation Plan

FY17 MILESTONE 6 | HAB Detection Technologies. Protect public safety and improve HAB and toxin detection and modeling by... supporting deployment of toxin sensors on ESPs; ...

- Provide continual development, upgrades, and operations of PST, microcystin and domoic acid sensors in Gulf of Maine, Great Lakes, and West Coast

Delivered

FY18 MILESTONE 6 | HAB Detection Technologies: Validate and transition HAB detection and monitoring products to provide identification and toxicity measurements for regional observing networks, states, municipalities and tribal nations.

- 2G-ESP microcystin sensor is demonstrated in an operational environment via deployment upstream of Toledo, OH water intake, with near-real time toxin data provided to stakeholders through GLOS HABs Data Portal in demonstration mode and used to support GLERL-NCCOS toxicity forecast development

On-Track

HAB SUB-PRIORITY IMPLEMENTATION PLAN: PRIORITY AREA 4. New detection technologies, such as test kits, autonomous sensors, and portable field instruments that enable local observations to support operational and demonstration forecasts, and provide states, municipalities and tribal nations with the ability to identify and quantify HAB species and toxicity.

- **STRATEGY:** Expand detection capability to more advanced platforms on smaller, faster and less costly devices that can sense multiple toxins and are accessible to diverse user groups.

R&D: Field-Portable Detection Technologies

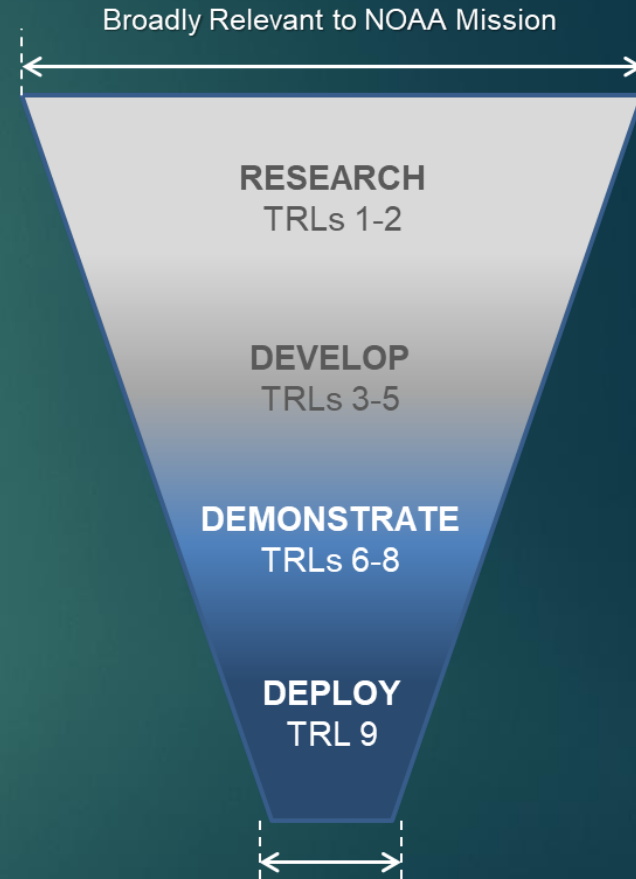

PERFORMANCE

Detection Technology R&D: Relevant and Responsive to the Needs of Managers and Coastal Communities - Transitioning Research to Ops, Apps, Commercialization (R2X)

Technology Readiness Level

- 1 ~1998: R&D initiated in response to the need for near-real time data on HAB species & toxin levels for managers, coastal communities, and researchers
- 2
- 3 2000: 1G ESP demonstrated as proof-of-concept; proceeded with improved re-design for 2G ESP
- 4
- 5 2006: 2G ESP/toxin sensor build completed and "mission qualified" with near-real time species/toxin detection in operational environment (Monterey Bay)
- 6
- 7 2007-2017: 2G ESP/toxin sensor (DA, PST, MCY) "mission proven" through multiple successful mission operations in five U.S. coastal regions
- 8
- 9 2G ESP commercial sales by McLane Research Labs
- 5 2016: 3G ESP System/subsystem/component validation in relevant environment – end-to-end DA detection in MB

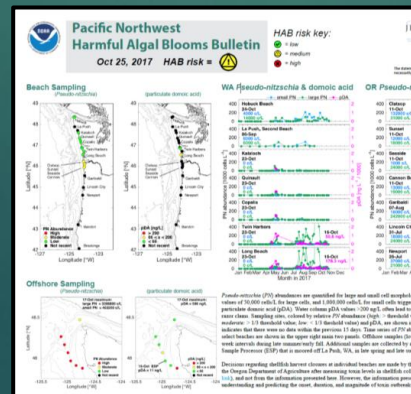

RELEVANCE

adapted from D. Lee

Essential for HAB Detection Technologies to Provide Beneficial Outcomes for Managers and Coastal Communities

- ❖ **The Need/Request:** lack of a rapid & effective means to assess toxicity associated with offshore blooms threatens shellfish harvests
- ❖ **The Response:** develop, validate, implement ESP DA sensor to deploy offshore for early warning of elevated bloom toxicity
- ❖ **The Output:** DA data for offshore toxicity source disseminated to managers in near-real time and included in the Experimental PNW HAB Bulletin

RELEVANCE

Essential for HAB Detection Technologies to Provide Beneficial Outcomes for Managers and Coastal Communities

Long Term -
Improved Conditions

Medium Term-
Better Actions

Short Term-
Learning

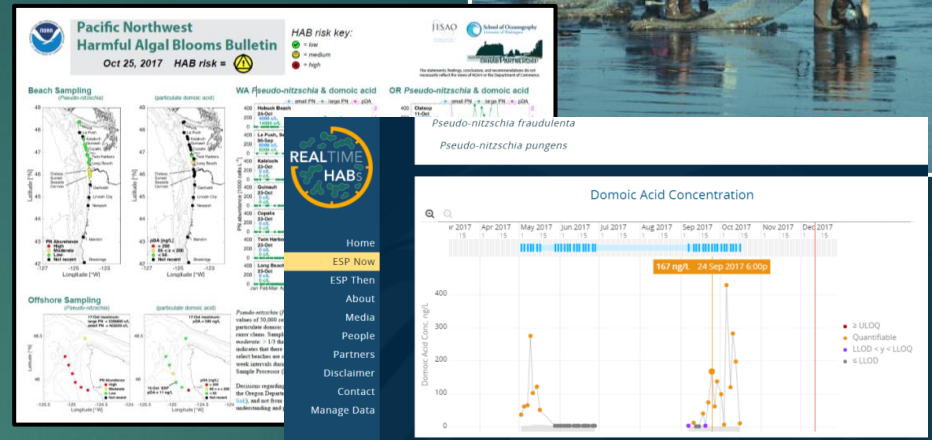

Long-term: data from ESP network integrated with HAB Bulletin; more accurate shellfish toxicity forecasts improve seafood/economic security for WA coastal residents

Medium-term: In 2017, ESP & other actionable data contributed to decision to increase daily razor clam catch limit - record digger trips; \$5.3 million was injected into local economies

Short-term: WA resource managers have learned that new knowledge of offshore HAB toxicity is available and can be factored into decision making process

HAB Detection Technologies: Making a Difference to Coastal Communities

Innovative

Responsive

Societal Benefits: enables proactive decisions essential for protecting public health and reducing severity of socioeconomic/sociocultural impacts

Making a Difference

Collaborative

WHO are we making a difference to?

The impacts of events such as the 2015 West Coast HAB on local communities and peoples lives are real...

Sociocultural & Economic Impacts

Community identity

Emotional wellbeing

“We all gather around razor clamming days or [go] crabbing together as part of an identification point for why we live here”

“...lose that social interaction that binds our community together”
(LB15, 2016)

“You can read Facebook posts from crabber's wives [and] you can tell it's not all good in the household” (LB3, 2016)

“It was pretty stressful, the whole thing. I think I grew gray hairs, I mean it was bad” (CC3, 2016)

4th generation fisherman
(Crescent City, CA)

...people in these communities are relying on better observations, early warnings, and forecasts to help managers reduce the severity of these HAB impacts on their lives and livelihood

The future: focus on continuing to transition NCCOS intramural HAB detection R&D into useful products that will benefit our customers

VISION:

*Science Serving
Coastal
Communities*

R&D Milestones for HAB Toxin Detection

202?

*R&D to realize smaller, faster,
less costly devices for HAB
monitoring & management*

NCCOS HAB toxin analysis support for marine mammal injury assessment

Natural resource damage assessments: support and consultation for oil spill events and hazard training courses

- Assessment: Deepwater Horizon, Texas City Y, Refugio
- Guidelines for Assessing Exposure and Impacts of Oil Spills on Marine Mammals (NOAA Response & Restoration)
- NOAA Science of Coastal Natural Disasters (HAB module)

Texas City Y OS Sample Analysis Plan:

NOAA proposes the following “rule out” set of laboratory analyses as part of this 2015 Sample Analysis Plan:

Biotoxin tests will be conducted to determine if a dolphin may have been exposed to a toxic algal bloom that was occurring in Texas at the time of the spill, which could have contributed to its cause of death.

Feces and stomach content samples will be analyzed using methods previously described and commonly employed (Maucher et al., 2007; Fire et al., 2008; Fire et al., 2011; Venn-Watson et al., in review) to determine if common disease symptoms or causes of mortality are indicated.

REFUGIO NATURAL RESOURCE DAMAGE ASSESSMENT

MAMMALS

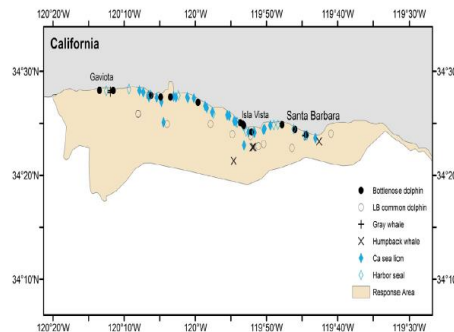

Wildlife response: Mammals collected alive: 63
23 rehabilitated and released
Mammals collected dead: 99
Total estimated mortality: **Pending**

Timeline of live and dead mammals collected

Pre-assessment survey: Marine mammal species sighted during the 2-7 June 2015 survey (left) designed to document coastal bottlenose dolphins (right) in the spill response area. Photo-identification data for coastal bottlenose dolphins will be analyzed to estimate the number of dolphins in the area after the spill.

Projects redefined with organizational change

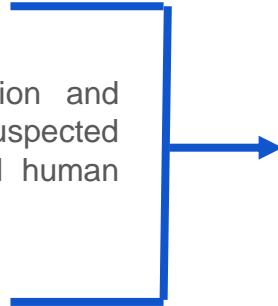

Harmful Algal Bloom and Analytical Response Branch

Analytical Response Team

To provide rapid and accurate identification and quantification of marine algal toxins in suspected HABs, marine animal mortality events, and human poisonings.

Technology Transfer

To validate the performance of high throughput receptor binding assays for algal toxins and to transfer the receptor assay technology to constituents who are responsible for monitoring algal toxin levels in fishery resources.

Harmful Algal Bloom Monitoring & Reference Branch

Focal Area 5 of SIM Subpriority
HAB Forecasting and Detection

Analytical Methods and Reference

Analytical methods and reference materials which leverage existing NCCOS expertise will be advanced in concert with other federal agencies participating in the HABHRCA IWG to support the development of standardized methods and training for testing laboratories and validation of their use to assure accurate and reproducible measurements nationwide.

NCCOS HAB Implementation Plan: Focal Area 5: Analytical methods and reference materials which leverage existing NCCOS expertise, are advanced in concert with other federal agencies participating in the HABHRCA IWG to support the development of standardized methods, training for testing laboratories and validation of their use to assure accurate and reproducible measurements nationwide

What	When due	Why	How	
Assure harmonized standard methods and reference materials Publish guidance for seafood safety managers	HABHRCA Interagency working group (IWG) subgroup on Analytical Methods and Reference Materials, Information (POC: John Ramsdell)	Annually	HABHRCA Act of 2014 requires NOAA under sec. 603A(f) to: (1) increase the availability to appropriate public and private entities of analytical facilities and technologies, operational forecasts, and reference and research materials; and (2) work cooperatively and avoid duplication of effort with other offices, centers, and programs within the National Oceanic and Atmospheric Administration, other agencies on the Task Force, and States, tribes, and nongovernmental organizations	CCEHBR, CCFHR, HQ staff time and multiple federal agencies

Method validation: LC-MS/MS of lipophilic toxins in shellfish

Quantitative determination of marine lipophilic toxins in shellfish using LC-MS/MS

International validation study - final report

Why we care.

- Shellfish containing lipophilic toxins can cause DSP
- Need for a harmonized analytical method for DSP-related toxins
- No accepted regulatory methods to control DSP hazards in shellfish

What we did.

- Evaluated method performance characteristics for determination of marine lipophilic toxins by LC-MS/MS using alkaline mobile phase -- Mussels, oysters, & cockles were tested for OA, DTX1, DTX2, AZA1, AZA2, AZA3, PTX2, YTX, and 45-OH-YTX
- NCCOS Charleston Marine Biotoxins Program met/exceeded data requirements (linearity, slope of calibration curve, sensitivity, error in ion ratios of MRM channels, error in retention time shifts)

Benefits - what's the difference?

- Quantitative determination of lipophilic toxins in shellfish for official control purposes
- Alternative to mouse/rat bioassay

What followed?

- EU Harmonised SOP for Determination of Lipophilic Marine Biotoxins in Molluscs by LC-MS/MS (2015)
- ISSC acceptance of LC-MS/MS Method for Monitoring DSP Toxins (FDA CFSAN 2017)

Recovery of lipophilic toxins from irregular matrices: dolphin urine & tissues

Why we care.

- Deepwater Horizon Natural Resource Damage Assessment called for evaluation of exposure to marine toxins in dolphins potentially affected by oil spill and related activities
- OR&R requested method validation detection of HAB toxins

What we did.

- Developed and validated a method for quantitative determination of lipophilic toxins (OA, DTX, PTX) in bottlenose dolphins (SPE-LC-MS/MS)
- Toxin recoveries ranged 80 - 130% (RSD < 15% using an optimized method; LOD \leq 0.7 ppb in urine, \leq 2.8 ppb in tissues)
- Evaluation of clean-up (SPE), LC separation, and MS detection
- Mobile phase aging, column temperature significantly affect analytical results

Benefits - what's the difference?

- Assure toxin recovery from irregular matrices (dolphin urine, tissues)
- Evaluate low levels of toxin exposure

What followed?

- Damage assessment data withstood scrutiny - responsible party liable for costs of assessment and implementation of restoration
- Method used to assess lipophilic toxin exposure in other at-risk populations

An example of data from our analytical method for DSP lipophilic suite of toxins

Date: 14 February 2017

Documented by: Maggie Broadwater, PhD

A. Suspected Event and Sample Details

Forty-one shellfish samples were submitted to the NCCOS HAB Monitoring and Reference Branch. Samples were assigned NOS ID numbers (SLM350 – SLM390) upon receipt in preparation for toxin extraction and analysis. Samples were extracted and a comprehensive list of diarrhetic shellfish toxins, including okadaic acid (OA), dinophysistoxins (DTX1 and DTX2), azaspiracids (AZA1, AZA2, AZA3), pectenotoxin-2 (PTX2), and yessotoxins (YTX, Homo-YTX, 45OH-YTX, 45OH-Homo-YTX) were determined. A complete sample list is provided in the data summary below (section D).

B. Findings

At least one toxin congener was detected in all 41 shellfish samples, and 39 samples exceeded the EU regulatory limit for at least one toxin group reported. Thirty-seven samples exceeded the EU regulatory limit for OA group toxins (160 ng OA equivalents per gram shellfish meat); positive values for total OA equivalents ranged from 14 – 12,255 ng per gram (median 767 ng per gram). Ten samples exceeded the EU regulatory limit for total YTX (3750 ng YTX equivalents per gram shellfish meat) and positive values for total YTX-eq ranged from 44 – 53,121 ng per gram (median 498 ng per gram). No samples exceeded the EU regulatory limit for total AZA (160 ng per gram shellfish meat); positive values for total AZA ranged from 1 – 144 ng per gram (median 8 ng per gram).

D. Data Summary

Table 1. Toxin concentrations in shellfish samples (ng toxin per gram shellfish);

DSP-associated toxins detected at levels > 75X action limit (160 ng per g shellfish)

ND = not detected (<dl). OA = okadaic acid; DTX1/2 = dinophys toxins; AZA1/2/3 = azaspiracids; PTX2 = pectenotoxin-2; YTX = yessotoxin. Values in bold indicate the sample exceeds the EU regulatory limit for the toxin group (OA, AZA or YTX). * Total OA, DTX2 and DTX1 were determined following hydrolysis of sample extracts and include the 7-hydroxy-acylated derivatives of these toxins (collectively termed DTX3).

Lipophilic toxins in the Pacific Northwest: Comparison of analytical methods

Why do we care?

- State agencies requested interlaboratory comparison of DSP toxin analysis and assessment of risk in WA shellfish
- Limited information on toxicity in algal species associated with DSP present in WA waters

What did we do?

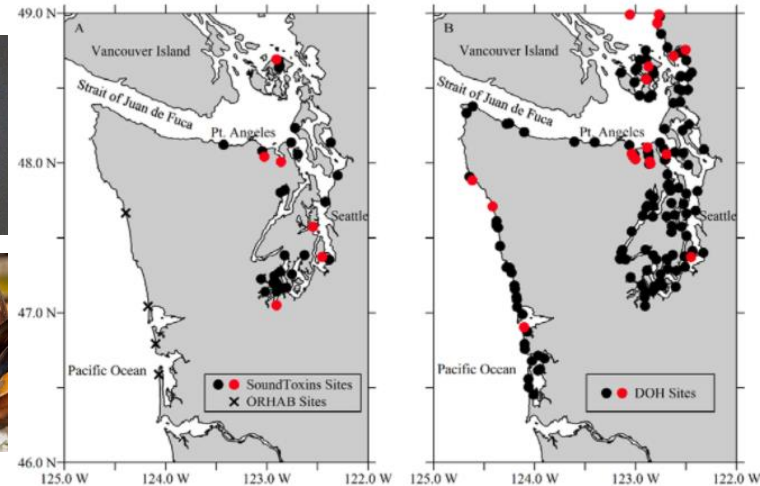

- Address matrix issues (matching vs. removal)
- Spike-recovery studies for quality control and determination of matrix-specific correction factors for quantitation
- Mussel homogenates analyzed by LC-MS/MS (WA DOH, NMFS NWFSC, and NCCOS Charleston)
- Compare alkaline and acidic toxin detection methods

Benefits - what's the difference?

- Assist state managers in establishing harmonized protocols for quantifying lipophilic toxins as part of routine state monitoring

What's next?

- Address FDA & EU regulatory standards for shellfish toxins
- Facilitate export of WA-grown shellfish to EU

Addressing program evaluation criteria

Quality

We develop, validate, and support analytical methods to address specific questions related to HAB toxins and their effects.

We generate quality data that are assured to be accurate using established methods.

We communicate results using formal reports reviewed by a team of interdisciplinary experts.

We assist in developing standardized protocols for the collection and analysis of environmental and animal samples for HAB toxin detection in scientific studies and hazard response assessments subject to scrutiny.

Performance

Our data are managed effectively and efficiently through a toxin analysis management team to achieve specific results.

We work with collaborators and partners within and beyond NCCOS and NOAA to develop and validate methods to advance a coordinated strategy for HAB science.

Our efforts are planned and tracked using the NCCOS HAB implementation plan.

We maintain capabilities and flexibility for event-driven consultation and analytical support to assure accurate science-based decision making during HAB events.

Relevance

HAB toxin detection methods developed and/or validated at the NCCOS Charleston laboratory have been successfully applied to serve management needs.

We provide actionable information to meet the needs of customers and stakeholders.

We work together with NCCOS HAB Forecasting and Competitive Research routinely, and in response to episodic HAB events.

NCCOS HAB analytical methods and related research have led to notable improvements in management and response to HABs and other hazards.

Progression of HAB response capabilities

1987 Dolphin UME--
Lack of robust and specific methods for measuring marine toxins

1992 National Plan

Effort to develop series of toxin class-specific methods

Reference methods
Regulatory application

Application of methods to determine event association with HABs

1993-2012 Support for mortality/morbidity events

ART-TAMT experience and routine for quality management

MBP and ART baseline data (lab/field exposure studies, response data) to support hazard assessment needs

Existing framework that demonstrates successful method application and quality performance metrics

Detection, forecasting, and competitive research provide a holistic response effort across NCCOS

Focus Area 5: Analytical methods and reference materials

Unfolding the Future: work in concert with other agencies leveraging vital assets to enable a network of HAB laboratories to serve the broad coastal community

What are Harmful Algal Blooms?
Harmful algal blooms (HABs) result when naturally-occurring freshwater and marine microorganisms, algae and cyanobacteria in surface waters grow and accumulate to high levels. These organisms produce potent chemical toxins that contaminate air, water, and food; harm humans, domestic animals, and wildlife; degrade the value of marine and freshwater ecosystems; and impact the economic well-being of communities. HAB events are widespread, affecting all U.S. states and territories and are increasing in frequency and severity. Understanding why and when HABs occur, and what makes them affect some, requires knowledge gained from a range of disciplines including biology, chemistry, environmental science, oceanography, meteorology, public health, and economics. A particularly important aspect of this work is the accurate measurement of HAB toxins. These measurements, however, often are difficult to obtain due to lack of certified reference materials (CRMs) required to quantify the diverse array of toxins produced by HABs.

Using CRMs to Communicate Risk

Why are CRMs for HAB toxins important?
It is important to determine and communicate the risks and economic impacts of HABs as accurately, effectively, and quickly as possible to minimize harm to people, the environment, and communities. CRMs are critical tools used by nearly every branch of science to provide the fundamental understanding required to accomplish this goal. As a specific example, CRMs are needed to demonstrate when drinking water and shellfish are safe or unsafe after suspected contamination by HAB toxins occur. If the amount of a toxin in a drinkable water source is determined to be above a safe level, officials can restrict the public not to drink contaminated tap water. If the water supply used for farming shellfish is contaminated, state officials can restrict their harvest, and protect consumers by keeping contaminated shellfish off of markets. However, because cutting off water supplies and creating concerns about seafood safety can have devastating effects on local economies, officials need reliable scientific measurements, which are best when linked to the use of a CRM. Unfortunately, laboratory lack CRMs for several classes of HAB toxins, restricting their ability to provide timely, cost-effective, and reliable monitoring.

What is being done?
While there are a number of CRMs produced by the National Research Council of Canada that meet certain needs for U.S. users, many of the other available standards (particularly those that are not CRMs) are of unknown or questionable quality, limiting the confidence of the materials when highly accurate results are needed, e.g., setting regulatory drinking water limits to ensure public safety.

The major challenges to identify the gaps where the national need for CRMs are paramount, but high-quality standards are not currently available. Improvements from eight Federal departments and agencies, are assessing the CRMs of greatest need for urgent communications from emerging and re-emerging HAB problems in the U.S.

- Goals**
- Make specific recommendations for CRM acceptance.
 - Encourage public awareness about CRMs and analytical methods for HAB toxins.
 - Facilitate scientific, federal and private partnerships to accelerate CRM development, and
 - Further coordinate federal action and leverage resources for producing critical CRMs.

IAEA
International Atomic Energy Agency
Atoms for Peace

The NOAA and IAEA collaboration on Harmful Algal Blooms

Under the collaboration framework ,

- The IAEA and NOAA work together to support IAEA Member States in the development and implementation of joint strategies and programmes concerning human health, seafood safety and the environmental impacts of HABs.
- The focus is on developing capacities for HABs monitoring, toxin testing and technology transfer applicable to HABs investigations with special attention is paid to the Receptor Binding Assay (RBA) methods for toxin in shellfish, which cause paralysis (PSP) and ciguatera.

Origin of the International Atomic Energy Agency

US President Eisenhower addresses the United Nations General Assembly delivering his "Atoms for Peace" speech, 8 December 1953, New York.

An "international atomic energy agency" to promote the peaceful uses of nuclear energy "for the benefit of all mankind."

IAEA

Head of the Department of Technical Cooperation

Dazhu Yang

Head of the Department of Technical Cooperation

The Department of Technical Cooperation is responsible for formulating and delivering the IAEA's development mandate. The Agency's technical cooperation with Member States aims to promote tangible socioeconomic impacts, supporting the use of nuclear science and technology to address major sustainable development priorities at the national, regional and interregional levels

Following a request made by the Philippines during the IAEA General Conference to identify possible measures to address the impacts of HABS, the IAEA initiated related Technical Cooperation projects to assist Member States in strengthening their capacities for prevention, management and mitigation of health and socioeconomic impacts of HABS.

The IAEA and the National Oceanic and Atmospheric Administration (NOAA) initiated concerted actions to develop and to validate a radioligand based method, the receptor binding assay (RBA).

Practical Arrangements between the International Atomic Energy Agency (IAEA) and the National Oceanic and Atmospheric Administration (NOAA)

These Practical Arrangements are made between the International Atomic Energy Agency (hereinafter referred to as the "IAEA") and the National Oceanic and Atmospheric Administration (hereinafter referred to as "NOAA").

The programmatic authorities for NOAA to enter into these Practical Arrangements are: Section 310 of the Coastal Zone Management Act (CZMA), 16 U.S.C. 1456; under which the Secretary is authorized to provide technical assistance in coastal zone management to further international cooperative efforts; The Oceans and Human Health Act, 33 U.S.C. 1301 et. seq. under which the Secretary is authorized to conduct integrated oceans and human health research on, among other things, harmful algal blooms and hypoxia and participate in international research efforts.

1. These Practical Arrangements provide a framework for the IAEA and NOAA to collaborate with IAEA Member States receiving technical assistance dealing with Harmful Algal Blooms (HABs) and their serious global impacts on human health, economies and ecosystem services. The working relationship between NOAA and IAEA may include the following:

- Collaboration in the development and implementation of joint strategies and programmes concerning human health, seafood safety and environmental impacts of HABs in IAEA Member States;
- Technical guidance from NOAA to the IAEA and its Member States directed to the development of capacity for HABs monitoring and toxin testing;
- Collaborative work for technology transfer applicable to HABs investigations and specifically to Receptor Binding Assay (RBA) methods for toxin detection;
- Joint facilitation of interlaboratory comparisons for the validation of RBA methods in IAEA Member States;
- Joint efforts to ensure sustained availability and evaluate the suitability of the radiolabelled tracers and other custom reagents (e.g. enzymes, membrane preparation) used for RBA methods;
- Exchange of data of mutual interest and relevance; and
- Cooperative dissemination of information and results using the RBA technology.

Activities (outputs) conducted between NOAA and IAEA

Expert Missions assist Member States to achieve self-reliance in IAEA coordinated projects. NOAA staff provide advice to counterparts in the field, lecture at training courses, and contribute to meeting/workshops.

Fellowships are awarded as part of an IAEA technical cooperation project in order to meet the needs of a Member State. They provide opportunities for training the necessary personnel to undertake the development of nuclear technology applications for peaceful purposes in their own countries.

Regional training courses/workshops support national training courses/workshops in cooperation with its Member States. Training courses are offered on peaceful uses and application of nuclear technologies, such as with the receptor binding assay for shellfish toxins

Assessment of Quality, Performance and Relevance

NOAA has worked with the IAEA Technical Cooperation Programme to apply nuclear technology to measure toxins such as saxitoxin and to transfer this capability to developing Member States in Africa, Asia, Latin America and the Arabian Gulf.

QUALITY:

A direct product of our joint action is the IAEA Technical Document entitled Detection of Harmful Algal Toxins Using the Radioligand Receptor Binding Assay: A Manual of Methods (IAEA-TECDOC-1729). Issued in 2013, this manual serves as a standard method for developing countries that wish to use the RBA method to monitor and respond to HAB events.

PERFORMANCE:

Technical training by NOAA experts continues to expand knowledge to Member States. Last year, the IAEA TC Programme supported two week-long training courses, one at the Kenya Marine Fisheries and Research Institute and another at the Center for Research in Environmental Pollution in Costa Rica training managers in 20 Member states on Africa and Latin America.

RELEVANCE:

Implementation of the RBA into monitoring programs support sustainable domestic and international markets. The Technical Cooperation Programme workshop at NOAA Charleston for Asia and Pacific region Member states this past July demonstrated the value of testing and use of regulatory monitoring programs for domestic and international markets with guidance from policy makers and regulators.

Jane Gerardo Abaya, Section Head of the Division for Asia and the Pacific of the Department of Technical Cooperation and POC for IAEA for the NOAA-IAEA Agreement.

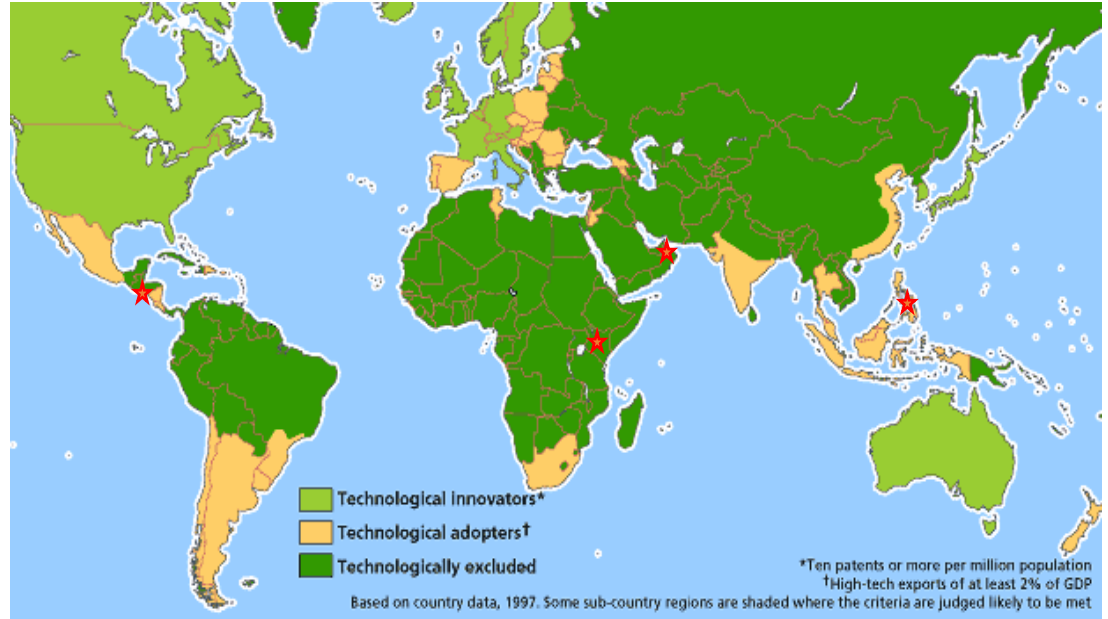

Today's world is divided by technology

Technological innovators: 15% of the earth's population, provides nearly all of the world's technology innovations

Technological adapters: Half of the world's population, is able to adopt these technologies in production and consumption.

Technologically excluded: The remaining part, covering around a third of the world's population, is technologically disconnected, neither innovating at home nor adopting foreign technologies

Transfer of Receptor Assay Technology to IAEA Member States

The **Global Innovation Index** provides detailed metrics about the innovation performance of 127 countries and economies around the world. the GII is a 'unique tool for refining innovation policies . . . for providing an accurate picture on the role of science, technology and innovation in sustainable development'

Transfer of Receptor Assay Technology to World Economies

arranged by 2008 GII Scores and GDP per capita

OUTCOME STORY- KENYA

Direct Benefit: Regional Training to Technology Excluded Economies

In December of 2016 the IAEA TC Programme supported a week-long training course at the Kenya Marine Fisheries and Research Institute in Monbasa, Kenya.

The training conducted by NOAA Technical Expert Tina Mikulski expanded PSP RBA from SW Africa (2004) to 11 additional Northern and Central African Member States

OUTCOME STORY- EL SALVADOR

Leveraged Opportunity: Institutional Operation for Technology Excluded Economy

Fisherman

Scientists

Conservationist

“In the last ten years we have had a red tide event almost once every year and so, with the cooperation of NOAA and IAEA, we are giving a timely response to the authorities and to the general public in order for the authorities to have a fundamental understanding in order to make a correct (rightful) decisions and possibly we are collaborating in order to protect human health.”

“In 2013 about 200 turtles were found stranded in our coastline. Through the RBA we could determine the reason of the turtle mortalities was intoxication due to high concentrations of saxitoxin. These results were obtained in a short period of time and at the same time these results were verified at NOAA and the IAEA laboratory in Monaco.”

Accreditation of RBA at LABTOX-UES will allow for increased surveillance of marine toxins to inform resource managers about the threat of HAB associated toxins to protected species and to increase the protection of public health while possibly expanding the economy through the exportation of shellfish.

OUTCOME STORY _ OMAN

Leveraged Opportunity: Institutional Operation for Technology Adaptor Economy

Oman Ministry of
Agriculture and Fisheries

Oman Achievements:

- Developed testing capacity and algal surveillance program
- Conduct response for fish kills

OUTCOME STORY-PHILIPPINES

Leveraged Opportunity: Institutional Operation/Global Promotion by Technology Adaptor Economy

As both capital and human capacities have been built to conduct the receptor binding assay worldwide in our cooperation with the IAEA, other institutions (such as the Philippine Nuclear Institute) are now acting as resource institutions and are taking on a greater role within the IAEA framework in providing services such as expertise, providing training via fellowships and conducting analytical services.

1. Direct benefits

These are **benefits** that will occur simply by virtue of the technology transfer taking place.

2. Leverage opportunities

These are the **additional benefits** that can be developed around the technology transfer itself.

3. Legacy opportunities

These are **the lasting or long-term benefits** that can be accrued beyond the technology transfer.

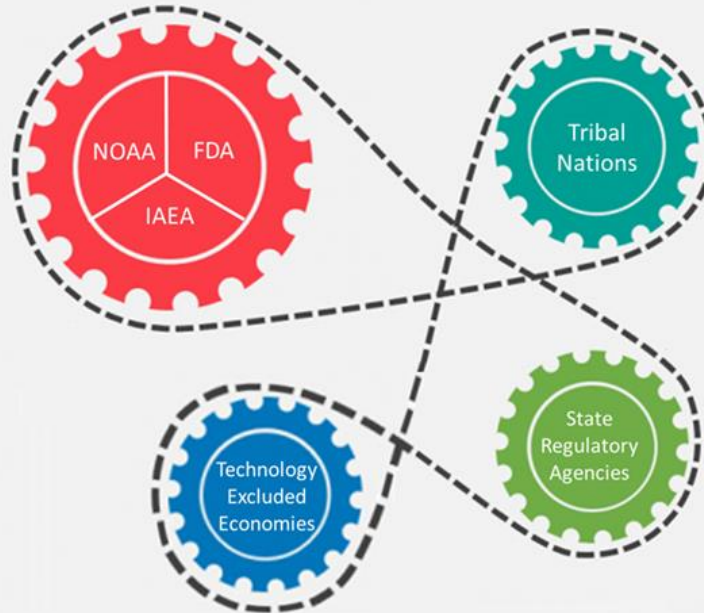

Building Capacity in Alignment with HABHRCA, NOAA and NCCOS

HABHRCA Act of 2014 requires NOAA under sec. 603A(f) to: Increase the availability to appropriate public and private entities of (A) analytical facilities and technologies, (B) operational forecasts, and (C) reference and research materials;

Work cooperatively and avoid duplication of effort with other offices, centers, and programs within the National Oceanic and Atmospheric Administration, other agencies on the Task Force, and States, tribes, and nongovernmental organizations to coordinate HAB and hypoxia activities and research.

**NAO 216-115A Section 3.02-
Transitioning research and development:**
Continually improving NOAA's products ...by developing the most promising research... to the point they can be transitioned into operations, applications, commercialization or other use (R2X).

Science serves to sustain

 **NCCOS** NATIONAL CENTERS FOR COASTAL OCEAN SCIENCE

thriving coastal communities and economies

HAB FOCUS AREA 5: Analytical methods and reference materials which leverage existing NCCOS expertise, will be advanced in concert with other federal agencies participating in the HABHRCA IWG to support the development of standardized methods and training for testing laboratories and validation of their use to assure accurate and reproducible measurements nationwide
