6. Lynker Technologies under contract to NOAA, NMFS, Northwest Fisheries Science Center, USA
7. BOEM, Pacific OCS Region, USA
8. NOAA, NMFS, Deep Sea Coral Research and Technology Program, USA

This study is funded in part by the U.S. Department of the Interior, Bureau of Ocean Energy Management, Environmental Studies Program, Washington, DC, through Interagency Agreement No. M16PG00014 with the U.S Department of Commerce, National Oceanic and Atmospheric Administration, National Ocean Service, National Centers for Coastal Ocean Science.

# Background

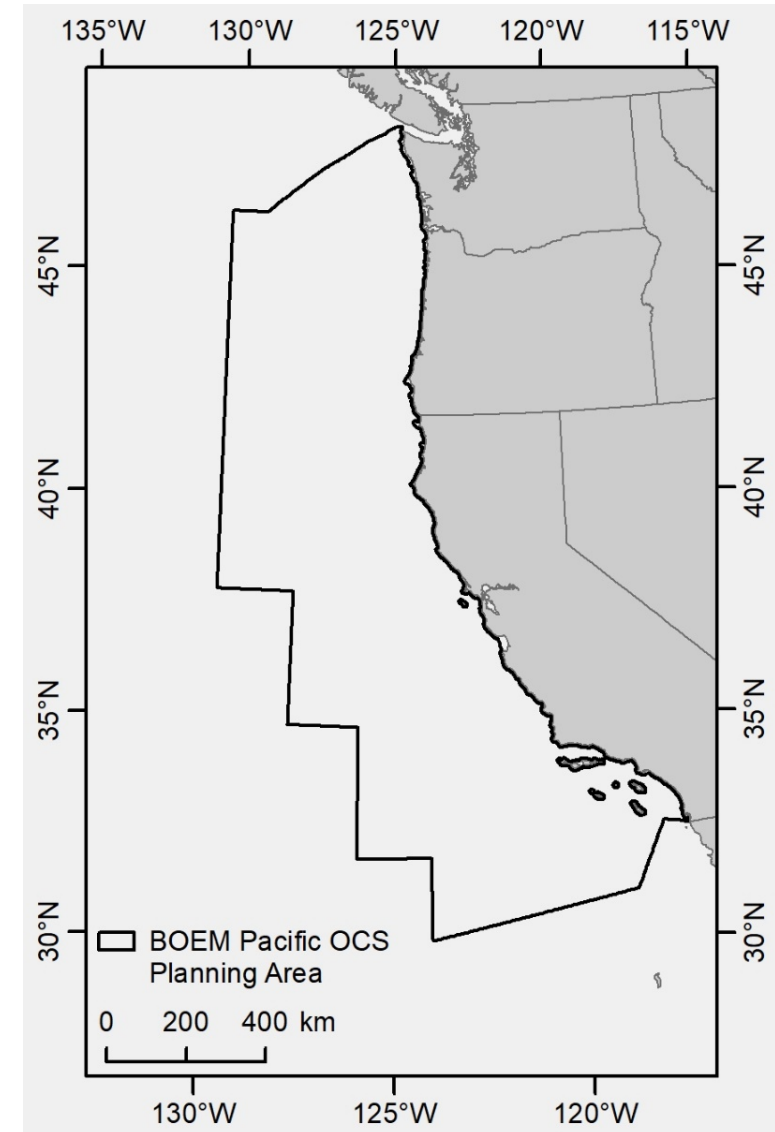

- Pacific OCS Region:  
BOEM oversees responsible development of energy and mineral resources for an extensive area offshore California, Oregon, Washington

Credit: Sarah Henkel,  
Oregon State University

Credit: NOAA SWFSC, Advanced  
Survey Technologies Group

# Objectives

- Compile observations of deep-sea corals and sponges (DSC&S)
- Identify potential environmental covariates
- Predict and map spatial patterns of habitat suitability
- Evaluate model performance
- Support management and exploration priorities

# Occurrence Data

- NOAA DSCRTP National Database

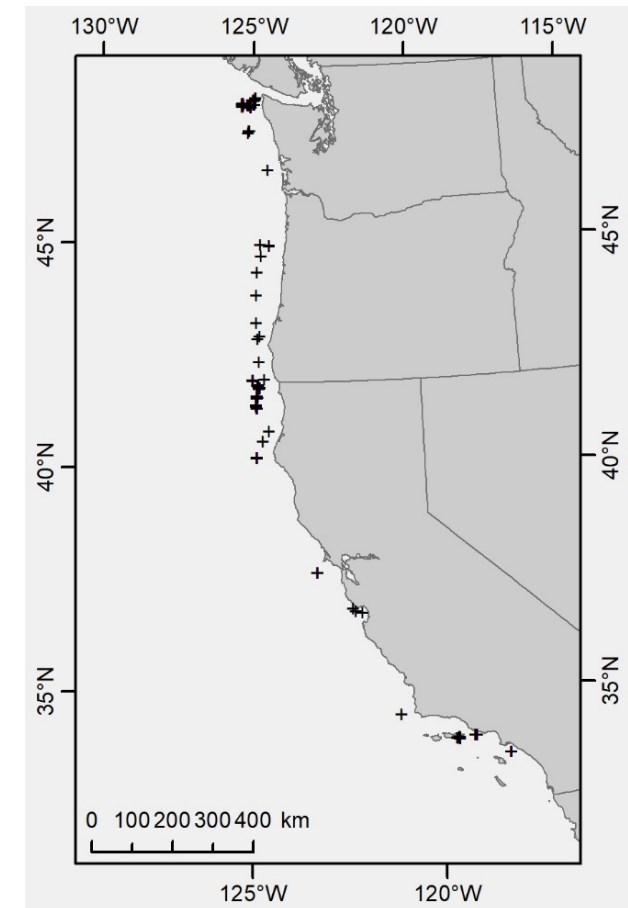

## DSC&S Presences

QA/QC  
Subset by Taxonomy  
Spatial Thinning

## *Swiftia pacifica* Presences

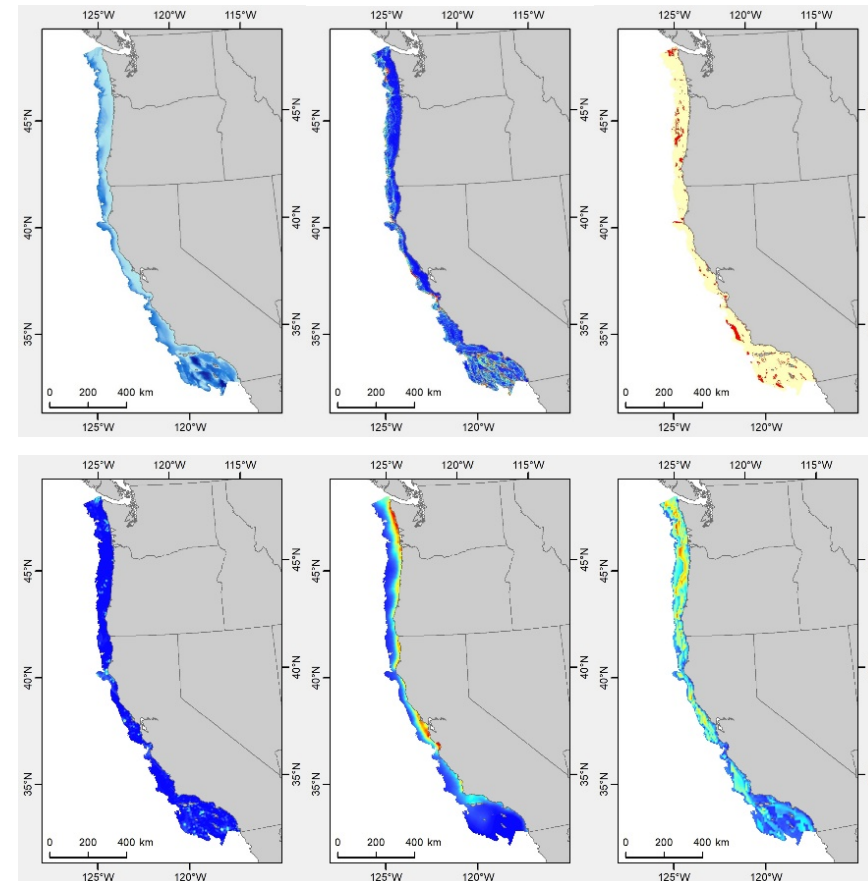

# Modeling Framework

## Step 1: Data preparation

### *Swiftia pacifica* Presences

### Spatial Environmental Predictors

# Modeling Framework

## Step 2: Model fitting

- Models fit using ‘maxnet’ package in R
- Presence/background data

Ecography 40: 887–893, 2017

# Modeling Framework

## Step 2: Model fitting (continued)

- Cross-validation using spatial blocking

Received: 19 January 2018 | Accepted: 5 October 2018

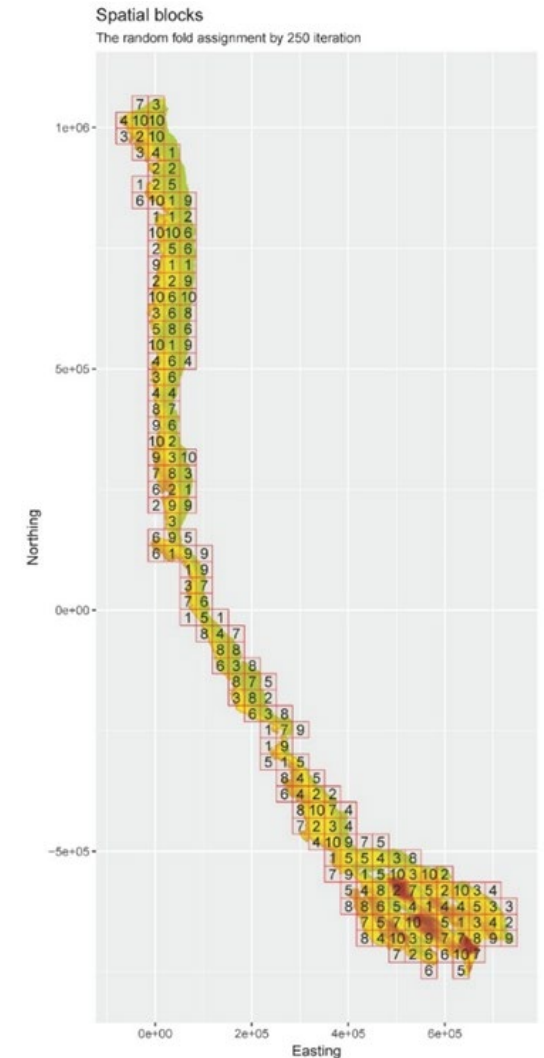

DOI: 10.1111/2041-210X.13107

### APPLICATION

Methods in Ecology and Evolution 

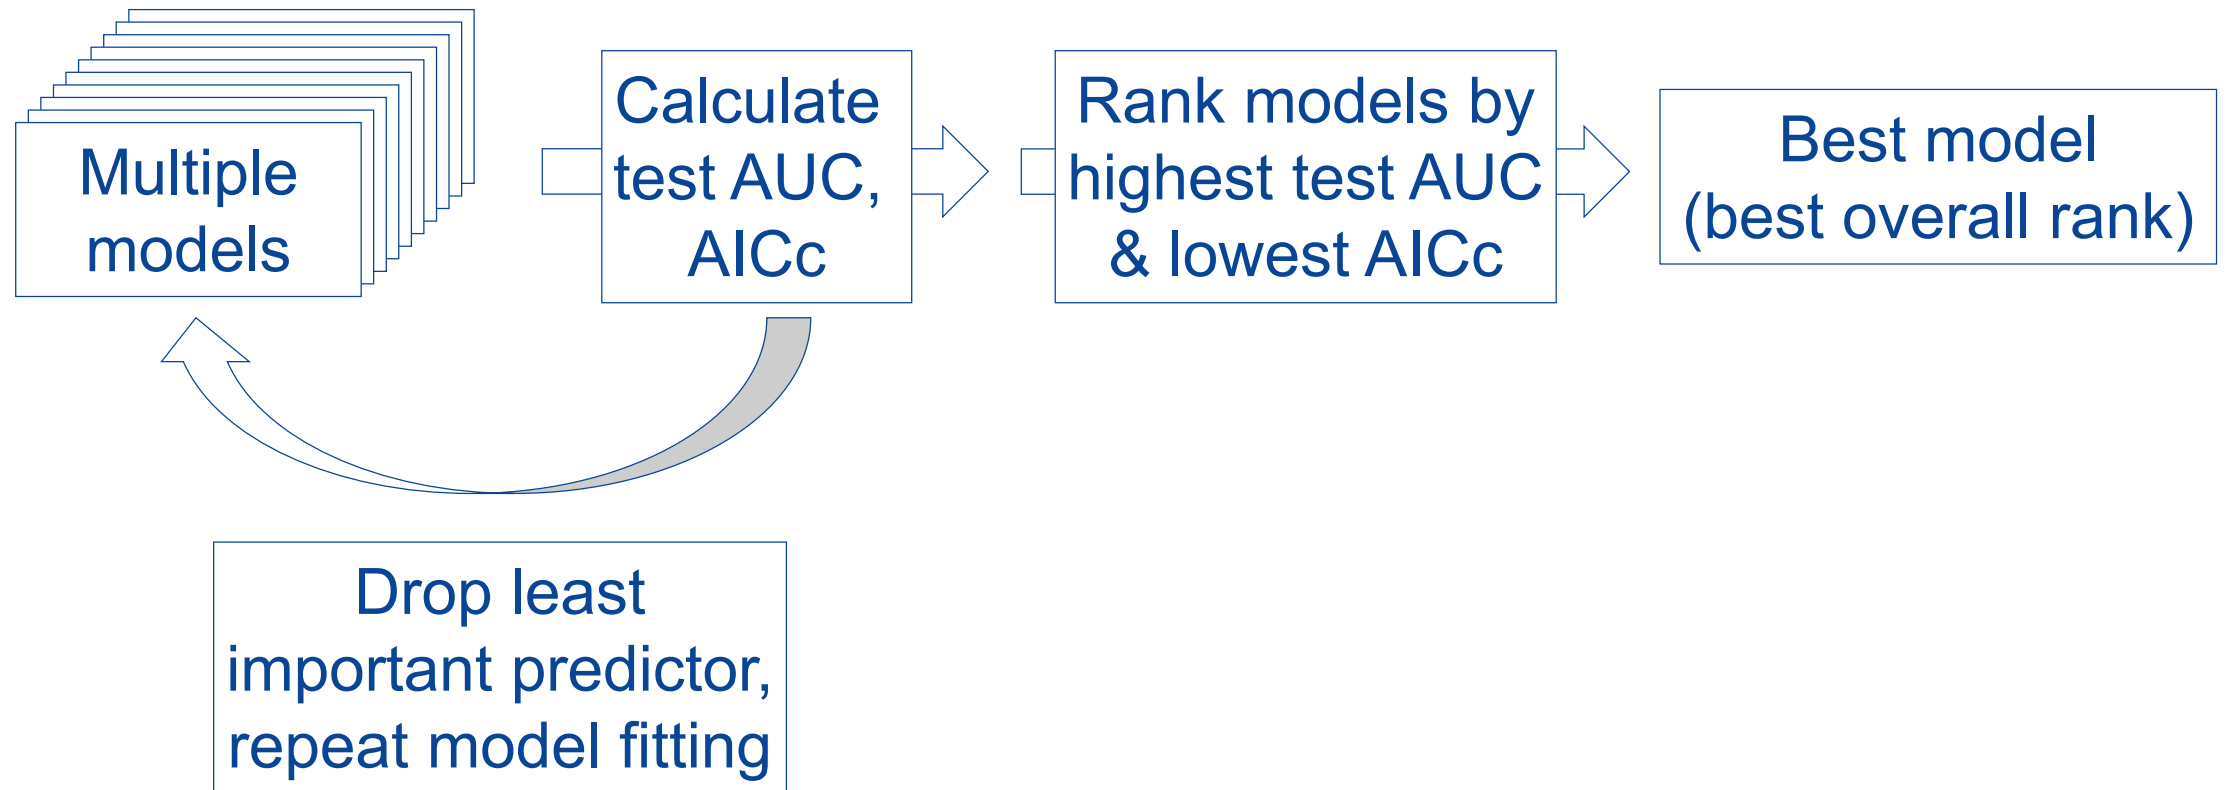

**BLOCKCV: An R package for generating spatially or environmentally separated folds for  $k$ -fold cross-validation of species distribution models**

Roozbeh Valavi  | Jane Elith  | José J. Lahoz-Monfort  |  
Gurutzeta Guillera-Arroita 

# Modeling Framework

## Step 3: Model selection

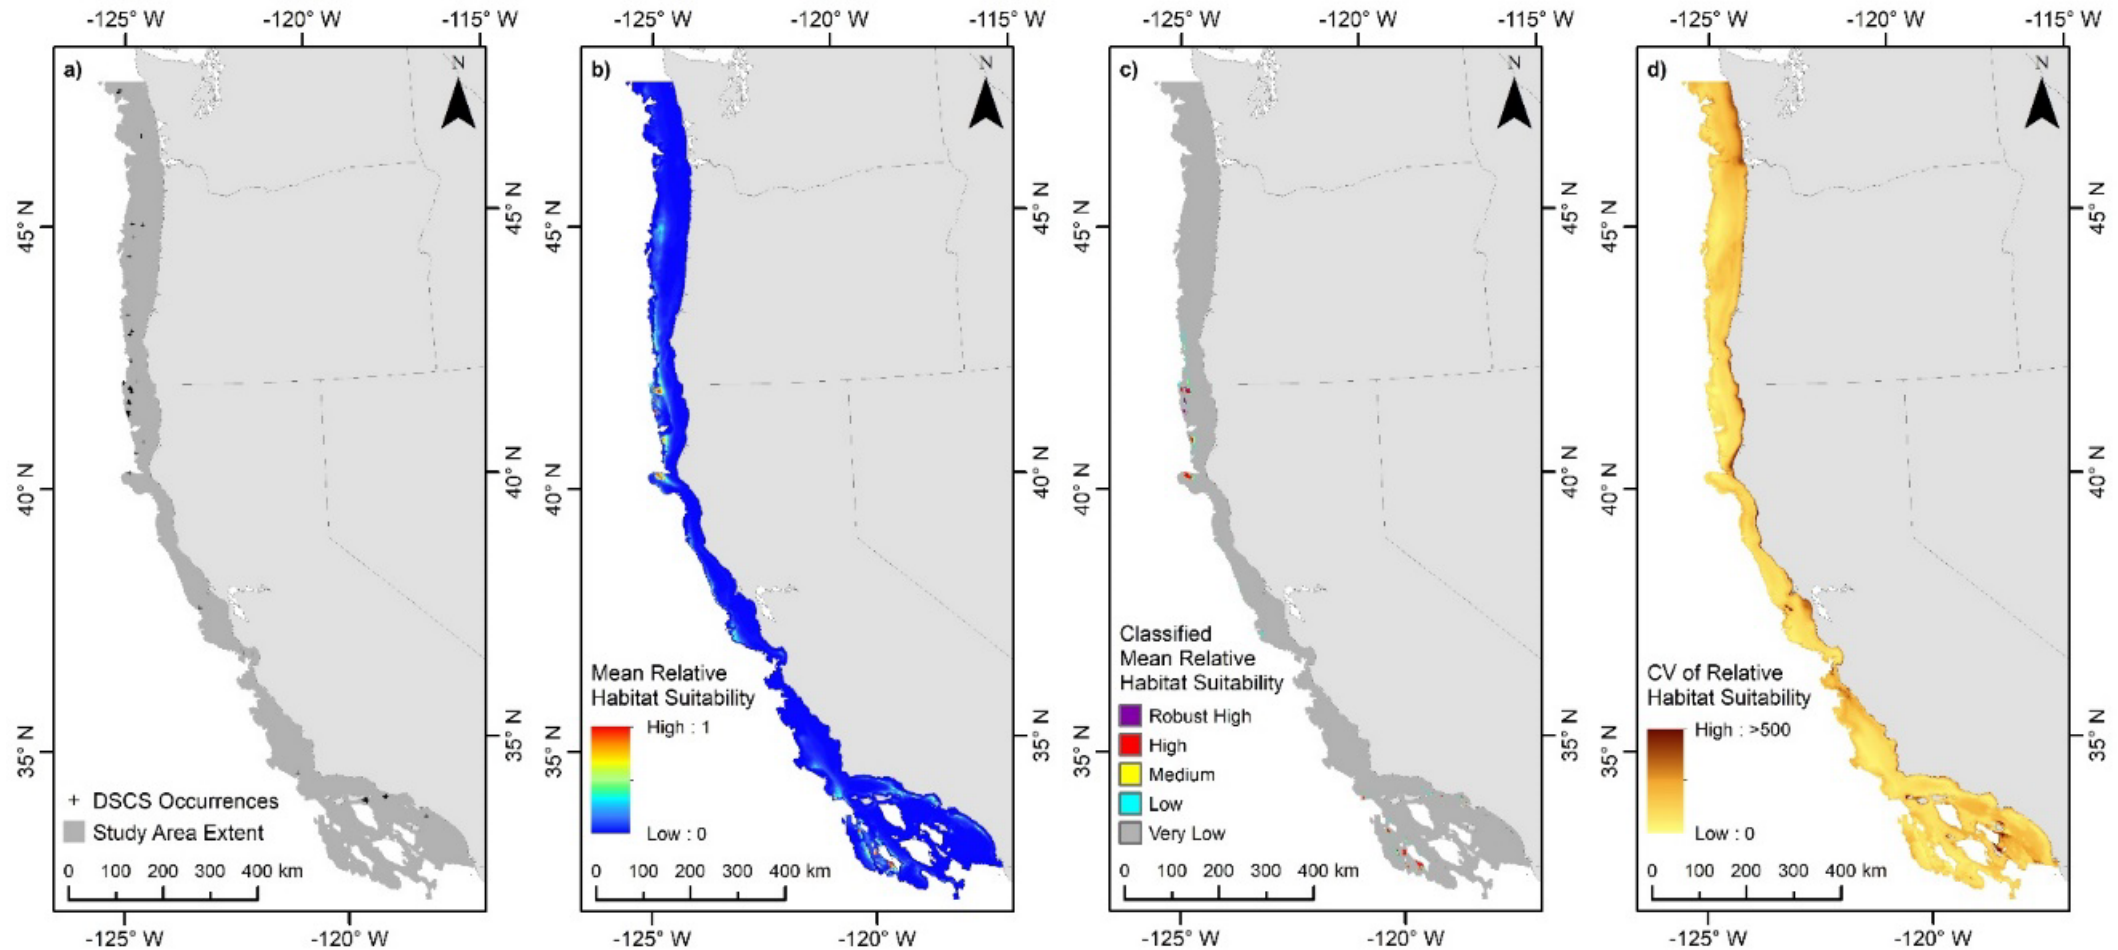

# Modeling Framework

## Step 4: Spatial prediction

- Create bootstrap samples
- Fit model for each bootstrap sample, using the predictors from the selected “best” model
- Make predictions at all model grid cells

# Map Pages

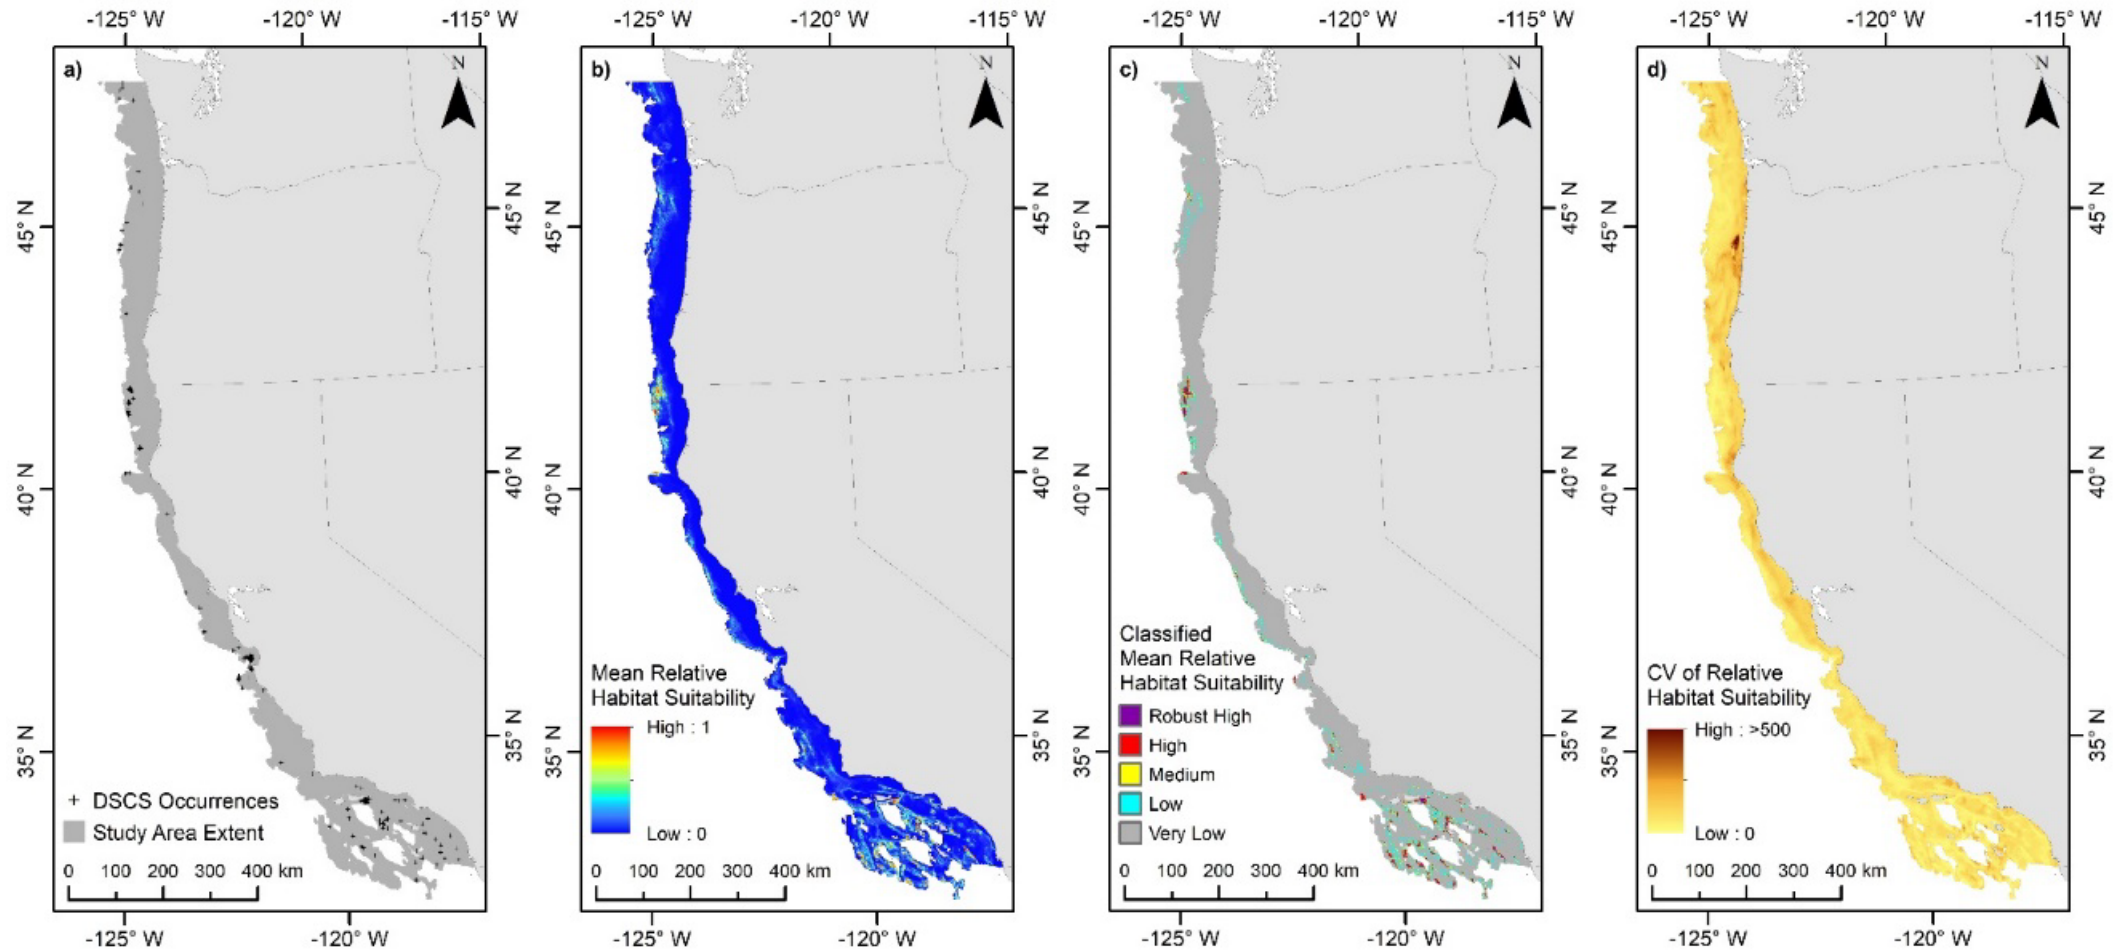

## *Swiftia pacifica*

Cross-Val Mean AUC: 0.83; Model Fit: 85%; Model Stability: 16%

# Map Pages

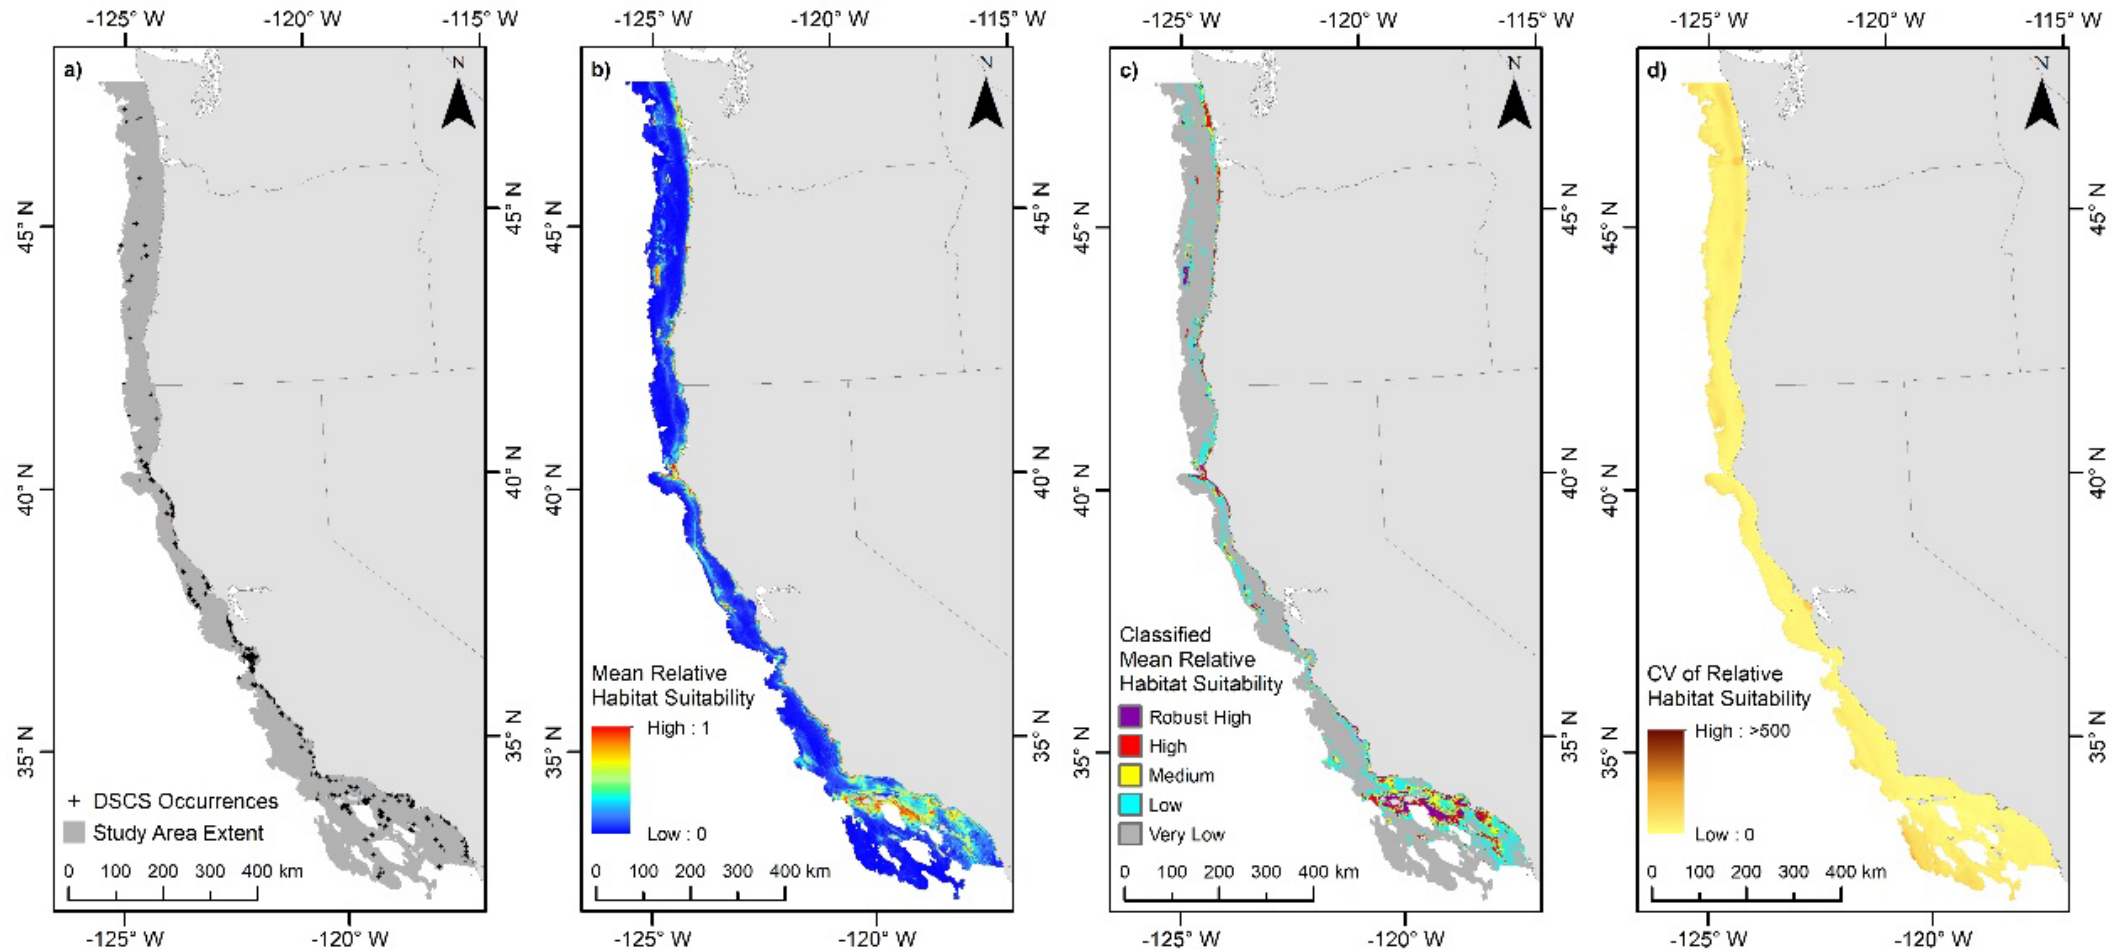

*Paragorgia spp.*

Cross-Val Mean AUC: 0.87; Model Fit: 91%; Model Stability: 23%

# Map Pages

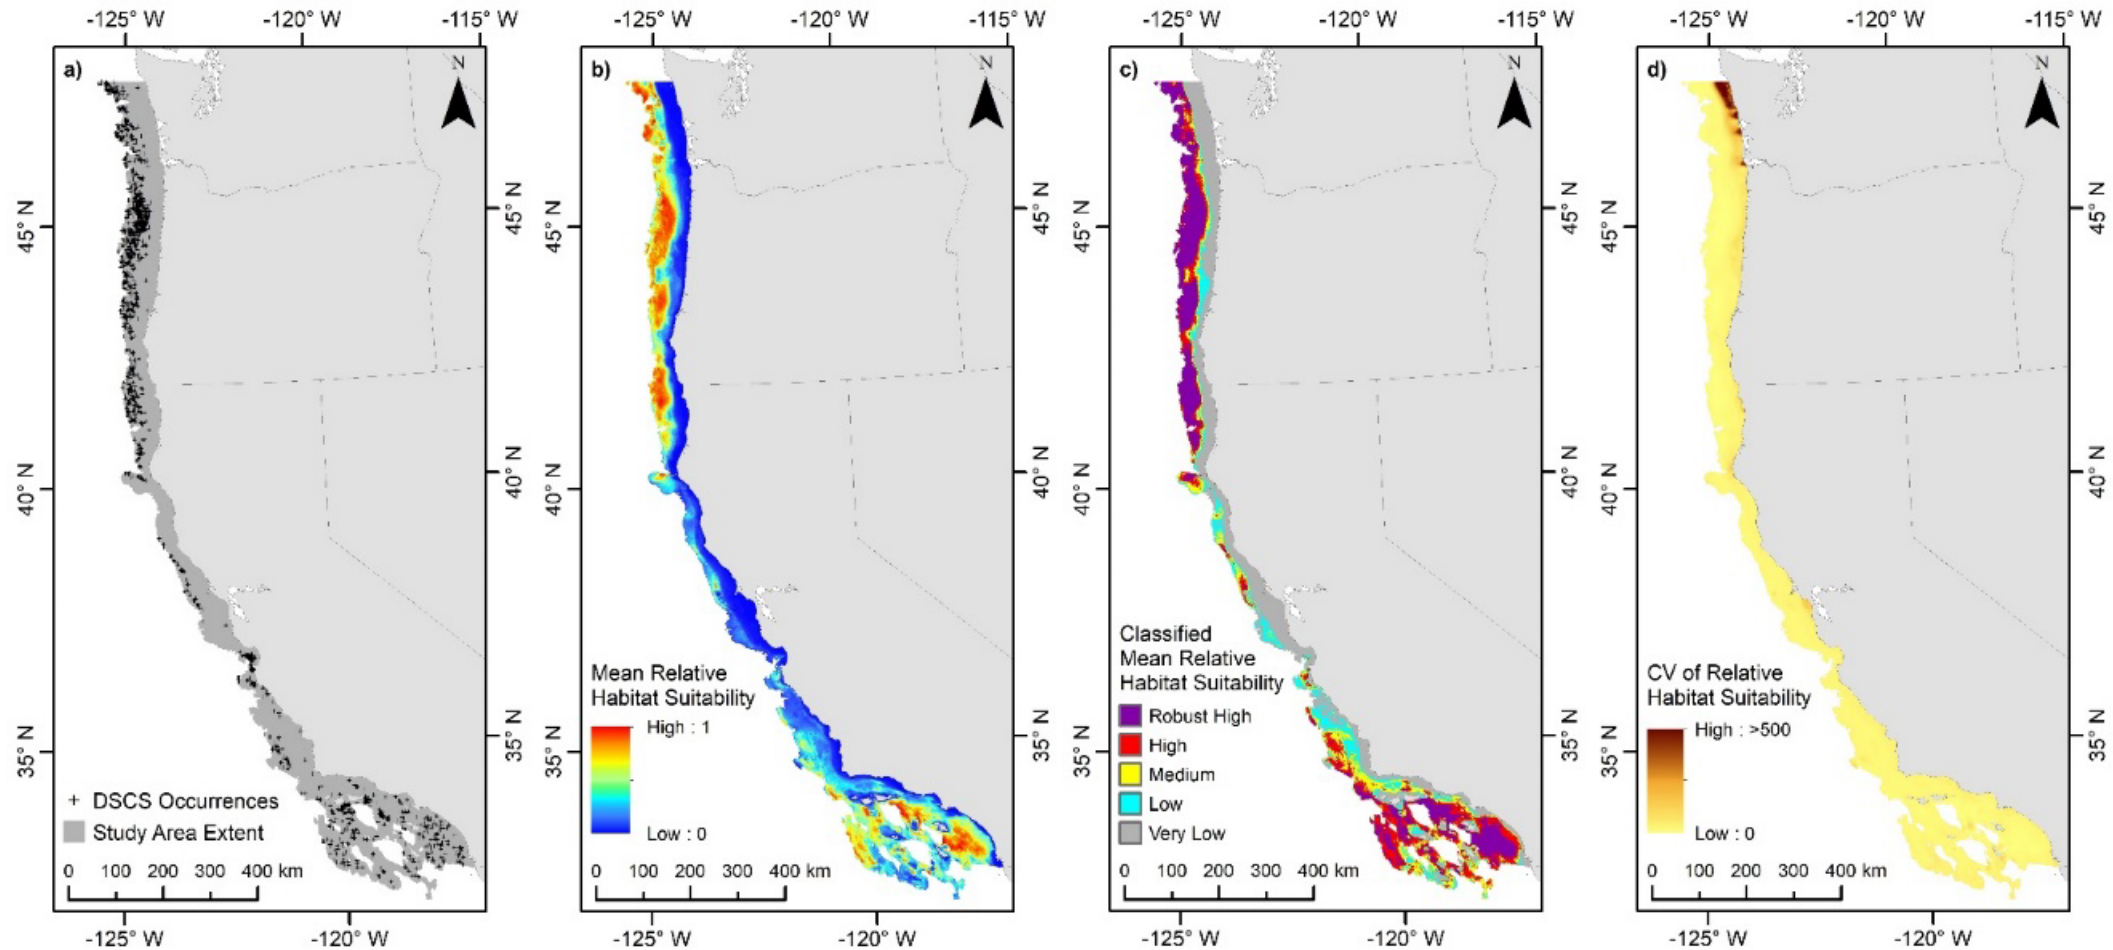

## Demospongiae

Cross-Val Mean AUC: 0.81; Model Fit: 90%; Model Stability: 43%

# Map Pages

## Hexactinellida

Cross-Val Mean AUC: 0.82; Model Fit: 86%; Model Stability: 61%

# Caveats

- Presence-only data
- Spatial and taxonomic precision of DSC&S records
- Scale/resolution of environmental predictors
- Missing environmental predictors

# Objectives

- Compile observations of deep-sea corals and sponges (DSC&S)
- Identify potential environmental covariates
- Predict and map spatial patterns of habitat suitability
- Evaluate model performance
- Support management and exploration priorities

‘Opportunistic’ field validation using data from EXPRESS

# Model Validation

## Ideal – Independent Field Validation

# Model Validation (cont.)

## Approaches

- Assess correlation between observations and model predictions
- Calculate accuracy measure using confusion matrix
- Fit GLMs to see if model predictions explain variation in observations

# Model Validation (cont.)

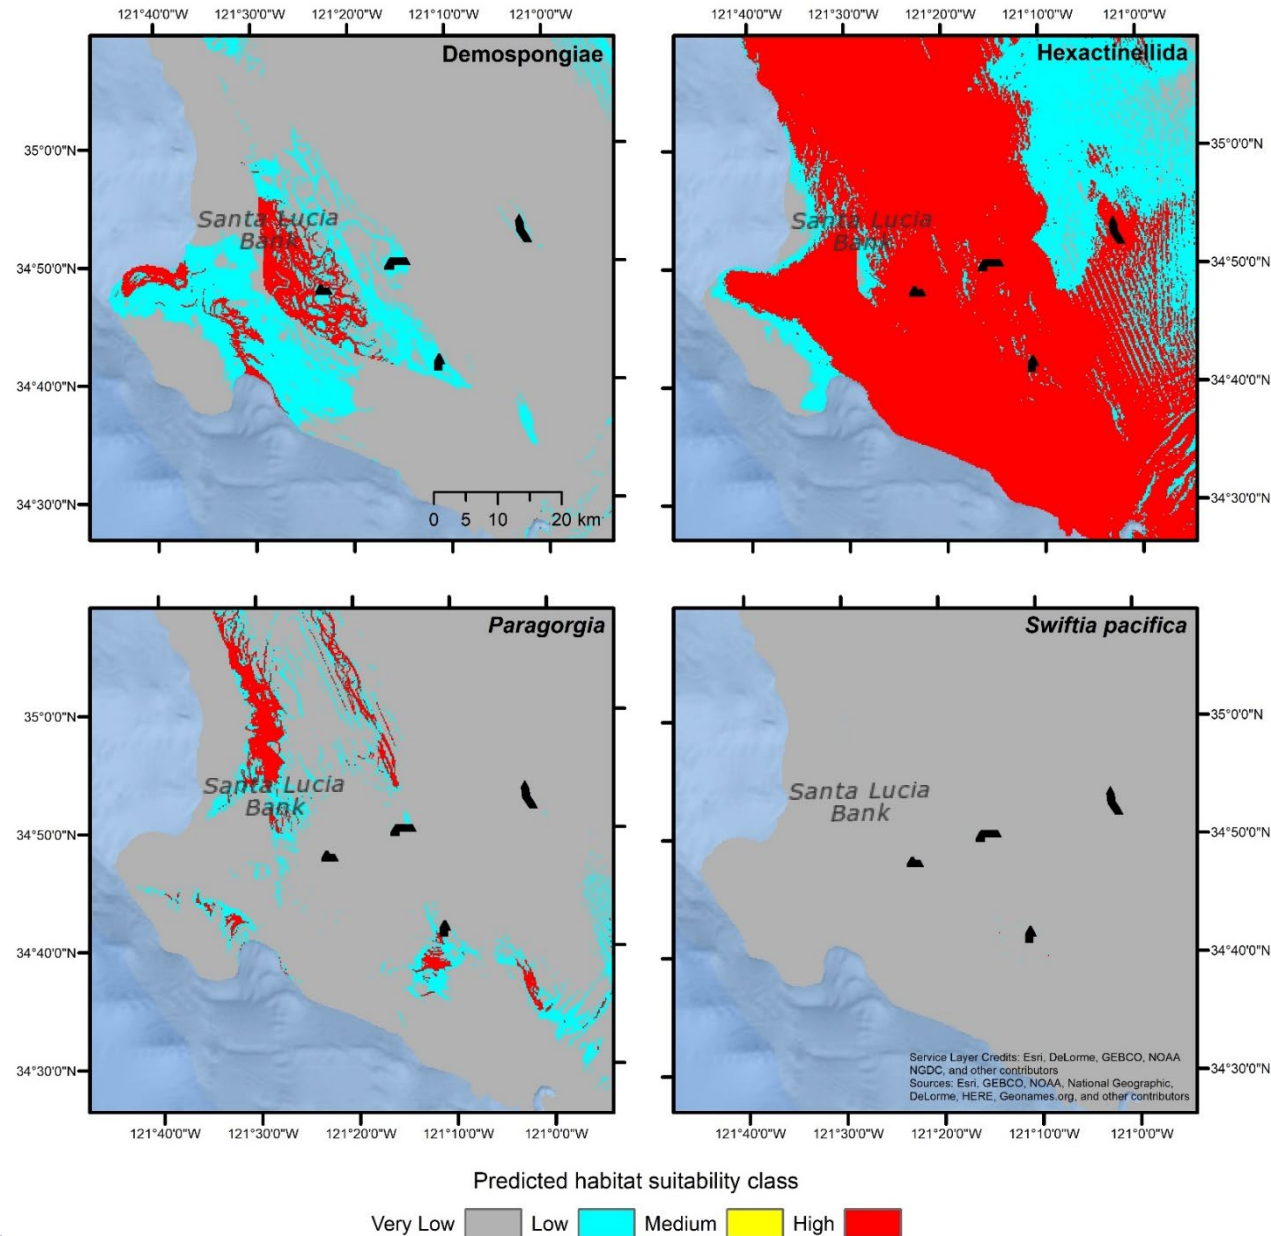

# Model Validation (cont.)

Table 1. Sample size (number of study grid cells with  $\geq 1$  image) by predicted habitat suitability class for each taxon. There were a total of 220 cells with images.

| Taxon                   | Predicted habitat suitability class |    |    |    |     |        |      |    |    |    |
|-------------------------|-------------------------------------|----|----|----|-----|--------|------|----|----|----|
|                         | Very low                            |    |    |    | Low | Medium | High |    |    |    |
|                         | 1                                   | 2  | 3  | 4  | 5   | 6      | 7    | 8  | 9  | 10 |
| Demospongiae            | 0                                   | 0  | 12 | 20 | 38  | 81     | 44   | 25 | 0  | 0  |
| Hexactinellida          | 0                                   | 0  | 8  | 9  | 20  | 6      | 56   | 79 | 33 | 9  |
| <i>Paragorgia</i>       | 89                                  | 15 | 69 | 14 | 23  | 1      | 2    | 5  | 2  | 0  |
| <i>Swiftia pacifica</i> | 24                                  | 49 | 52 | 69 | 17  | 0      | 9    | 0  | 0  | 0  |

# Model Validation (cont.)

# Model Validation (cont.)

Table 2. Results of statistical analyses of the relationship between taxa occurrence and predicted habitat suitability (MaxEnt ‘raw’ predictions): 1) Spearman rank correlation coefficient ( $r$ ) between proportion of images where taxa were present and predicted habitat suitability; and 2) quasi-Poisson generalized linear model (GLM) of number of images where taxa was present as function of predicted habitat suitability. For the GLM, the percentage of deviance explained by the model and the  $p$ -value of the positive effect of predicted habitat suitability are presented.

| Taxon                   | $R$  | GLM                  |       |
|-------------------------|------|----------------------|-------|
|                         |      | % deviance explained | $p$   |
| Demospongiae            | 0.24 | 9                    | <1e-7 |
| Hexactinellida          | 0.27 | 1                    | 0.135 |
| <i>Paragorgia</i>       | 0.44 | 0                    | 0.894 |
| <i>Swiftia pacifica</i> | 0.14 | 5                    | <0.01 |

# Model Validation (cont.)

## Conclusions

- Challenging to collect samples across range of model predictions when using ‘opportunistic’ samples
- When incorporating different sources of data (e.g., AUV + ROV), need to consider sampling effort
- Important to link modeling efforts with exploration

## Next steps

- Continue opportunistic collection of data for model validation
- Additional models using absence, abundance data
- Explore additional environmental predictor variables
